THE MOTH BOOK
THE MOTH BOOK
A POPULAR GUIDE TO A KNOWLEDGE OF THE MOTHS OF NORTH AMERICA

BY
W. J. HOLLAND, D. D., Ph. D., Sc. D., LL. D.

DIRECTOR OF THE CARNEGIE MUSEUM, PITTSBURGH, PA.; LATE CHANCELLOR OF THE WESTERN UNIVERSITY OF PENNSYLVANIA; PRESIDENT OF THE ENTOMOLOGICAL SOCIETY OF WESTERN PENNSYLVANIA; FELLOW OF THE ZOOLOGICAL AND ENTOMOLOGICAL SOCIETIES OF LONDON; MEMBER OF THE ENTOMOLOGICAL SOCIETY OF FRANCE; ETC., ETC.

WITH FORTY-EIGHT PLATES IN COLOR PHOTOGRAPHY, AND NUMEROUS ILLUSTRATIONS IN THE TEXT, REPRODUCING SPECIMENS IN THE COLLECTION OF THE AUTHOR, AND IN VARIOUS PUBLIC AND PRIVATE COLLECTIONS

Garden City New York

W. J. HOLLAND
TO MY HONORED FRIEND,

ANDREW CARNEGIE,

WHOSE NAME IS A SYNONYM FOR FINANCIAL

SAGACITY AND PRACTICAL BENEVOLENCE,

I DEDICATE THIS BOOK
WHEN a few years ago I published "The Butterfly Book," I stated in the preface to that volume that I would follow it by the preparation of a similar work upon the moths of the United States and Canada, provided the reception given that venture should seem to justify me in so doing. "The Butterfly Book" was very favorably received, and not only I, but my publishers, have been besieged with letters from all parts of the continent, urging the fulfillment of the provisional promise made by me in 1898. A prompt compliance with these requests has, however, unfortunately been impossible, owing to the fact that my official duties, which are numerous and exacting, prevent me from devoting any but the evening hours to the work of literary composition. In addition to the difficulties arising from this source, there were other and even greater difficulties which presented themselves. The species of moths known to occur in the United States and Canada vastly exceed in number the species of butterflies found within the same limits. While it was possible to bring together brief descriptions and numerous illustrations of the majority of the species of butterflies found in the region, it became evident at the outset that in dealing with the moths it would be necessary to resort to a different method. It became plain that a process of selection would have to be followed, if the volume were to be kept within proper limits as to size and cost. It would have been comparatively easy to have selected from the abundant material at my command a series of the more showy insects, and to have illustrated these, but as it is the purpose of the series of the books of which "The Moth Book" is one to provide in reasonably compact form manuals which will with tolerable completeness cover the whole field, the plan had to be materially altered. Instead, therefore, of attempting to briefly describe and figure all the thousands of species of moths which have been ascertained to
occur in North America north of Mexico, the effort was made to select those species which would adequately represent the various families and the commoner and more important genera, thus providing a work which might serve as an introduction to the study. This process of selection had to be made with much patience and care. Another cause of delay arose from the fact that it is sometimes difficult to obtain perfect specimens for purposes of photographic reproduction. Even where species are well known and common, and are abundantly represented in the collections to which I have access, it has not infrequently happened that it was almost impossible to discover specimens so perfect as to allow of their being reproduced by color-photography in a satisfactory manner. Minor defects, which signify little to a working naturalist, and which can easily be eliminated from sight by a draughtsman, become very serious blemishes when resort is had to methods of photographic illustration. Much time had, therefore, to be spent in searching through various collections for the kind of material which was required, and often in remounting specimens which, while good enough for the cabinet, were not so set as to permit them to be employed in the photographic laboratory. Patience and perseverance, however, always bring in due time their reward, and I have been able to assemble enough properly prepared material to enable me in the main to accomplish my purpose.

"Brevity is the soul of wit," and this fact has not been forgotten by the writer in preparing the pages of this book. The limitations necessarily imposed by the space available precluded the preparation of lengthy descriptions. This brevity in description is, however, as the writer believes, abundantly compensated for by the illustrations in the Plates. One good recognizable figure of a species is worth reams of mere verbal description. Those who desire to go deeply into the subject, and who wish to familiarize themselves with all its technicalities, will find in the list of works named in that part of the introduction devoted to the bibliography of the subject much that they desire.

I am indebted to many scientific friends for assistance, but to no one am I more indebted than to Dr. L. O. Howard, the Entomologist of the United States Department of Agriculture and the Honorary Curator of Entomology in the United States National Museum, and to his amiable associates, Dr. William H. Ashmead
and Dr. Harrison G. Dyar. With unfailing courtesy these gentle- 
men most generously aided me by allowing me to use the 
material in the National Collection, when it became necessary to 
do so, and in many other ways gave me invaluable help. I 
gratefully acknowledge the kindness of Professor J. B. Smith, of 
Rutgers College, who very graciously went over the Plates con-
taining the Noctuidae, thereby saving me in several instances 
from errors in determination. My best thanks are due to Mr. 
William Beutenmüller, the Curator of Entomology in the 
American Museum of Natural History, New York, for his most 
obliging courtesy and for much valued assistance. To Mrs. 
Beutenmüller's facile fingers I owe the frontispiece and many 
illustrations in the text. To Sir George F. Hampson, of the 
British Museum, and to the Trustees of that great institution, 
a debt of gratitude is due for many favors, and especially 
for permission to use some of the illustrations employed in 
their publications. From Dr. Henry Skinner, of the Academy of 
Natural Sciences in Philadelphia, and Mr. Jacob Doll, of the 
Brooklyn Institute, I received great assistance. To the Messrs. 
F. A. and H. S. Merrick, of New Brighton, Pa., to Dr. William 
Barnes, of Decatur, Ill., and to Mr. O. C. Poling, of Peoria, Ill., I 
return thanks for the loan of specimens used for illustration. 
The Honorable Walter Rothschild and Dr. Carl Jordan, of Tring, 
England, placed me under special obligations by permitting me to 
see advance proofs of the pages of their great work upon the 
Sphingidae. To all of these gentlemen, as well as to scores of 
others, who have lent their aid in the preparation of the book, I 
extend my heartfelt thanks.

While recognizing its imperfections, I trust that the volume 
will accomplish much to quicken an interest, especially among 
the young people in our schools and colleges, in that beautiful 
department of scientific inquiry, which it is designed to some 
extent to illustrate.

September 8, 1903.

TABLE OF CONTENTS

Dedication ........................................... v
Preface ................................................ vii
Table of Contents ................................... xi
List of Illustrations in the Text ................. xv
List of Colored Plates ............................. xxiii

INTRODUCTION

CHAP.  PAGE
I. The Life-History and Anatomy of Moths . . 3-18
   How to distinguish a moth from a butterfly. The Eggs of
   Moths; Caterpillars: Structure, Form, Color, Habits, etc.; The
   Pupae of Moths: Form, Covering, etc.; Anatomy of Moths:
   Head, Thorax, Abdomen, Legs, Wings.

II. The Capture, Preparation, and Preservation of Speci-
   mens ........................................... 19-21
   Special Instructions for Mounting and Preparing the Smaller
   Forms.

III. The Classification of Moths .................. 22-26
   The Difficulties of Classification. Various Views Entertained

IV. Books about the Moths of North America . . 27-38
   Early Writers. Periodicals. General Catalogues and Lists.
   General Works Containing Information as to the Moths of
   North America. Works Particularly Useful in Studying the
   Different Families of the Moths of North America.

INTRODUCTION
INTRODUCTION

CHAPTER I

THE LIFE-HISTORY AND ANATOMY OF MOTHS

"I suppose you are an entomologist?"

"Not quite so ambitious as that, sir. I should like to put my eyes on the individual entitled to that name. No man can be truly called an entomologist, sir; the subject is too vast for any single human intelligence to grasp."

Oliver Wendell Holmes, The Poet at the Breakfast Table.

The great order of the scale-winged insects, or lepidoptera, by the consent of almost all naturalists has been subdivided into two suborders, the Rhopalocera, or Butterflies, and the Heterocera, or Moths. As Dr. David Sharp well says, "The only definition that can be given of Heterocera is the practical one that all Lepidoptera that are not butterflies are Heterocera."*

The distinction made between butterflies and moths, according to which all lepidoptera having clubbed antennae are to be classified as Rhopalocera, or butterflies, and those without clubbed antennae are to be classified as Heterocera, or moths, while holding good in the main, yet is found with the increase of our knowledge to have exceptions, and there are a few families of lepidoptera, apparently forming connecting links between the butterflies and the moths, in which, while most of the structural characteristics are those of the Heterocera, the antennae are distinctly clubbed. This is true of the Castniidae, found in tropical America, the Neocastniidae of the Indo-Malayan region, the Euschemonidae of Australia, and certain obscure genera of the Agaristidae, among them that remarkable insect, Dahlia hesperioides Pagenstecher, which occurs in the

The Life-History and Anatomy of Moths

Bismarck Archipelago and the island of Buru. When, a few years ago, I communicated a specimen of this strange little moth to Sir George F. Hampson, he suggested that a trick had been played and that the head of a butterfly (a skipper) had been affixed to the body of a moth, but such was not the case, as a considerable series of specimens in my possession showed. The incident reveals that in classification hard and fast lines, based upon the character of a single organ, can not be always adhered to. There is scarcely any generalization in reference to organic structures which students have made which has not been found with the increase of knowledge to have its limitations. While all this is true, it is nevertheless also true that, so far as the lepidoptera of the United States and the countries of British North America are concerned, the old distinction between the two suborders, based upon the form of the antennae, holds good, with the sole exception of the insects belonging to the genus *Megathymus*, which are by many authors classified with the *Castniidae*, and by others with the *Hesperiidae*. In the “Butterfly Book” I have left these insects with the *Hesperiidae*. Leaving them out of sight, we may say that all lepidoptera found in the region with which this book deals, and which do not possess clubbed antennae, are moths. The easiest way for the beginner who lives in the United States, or Canada, to ascertain whether the insect before him is a moth, is to first familiarize himself with the structure of the antennae of butterflies, and then by comparison to refer the specimens before him to their proper suborder.

Moths undergo metamorphoses analogous to those through which butterflies pass. They exist first in the embryonic form as eggs. When the eggs hatch the insects appear as larvae, or caterpillars. They are then, after undergoing a series of molts, transformed into pupae, or chrysalids, which may be naked, or may be provided with an outer covering, known as the cocoon, which is more or less composed of silk. After remaining for some time in the pupal state, they appear as perfect *four-winged*, six-footed insects.

**THE EGGS OF MOTHS**

The eggs of moths, like those of butterflies, consist of a shell containing the embryo and the liquid food upon which it subsists.
until it has attained the degree of maturity which permits it to hatch, or come forth in the first larval stage. The eggs of moths have various forms. Spherical, hemispherical, cylindrical, and lenticular, or lens-shaped eggs are common. The eggs of the Cochlididae, or Slug-moths, are broad and very flat, looking like microscopic pancakes. The surfaces of the eggs of moths are seen under a microscope to be more or less ornamented by raised lines and sculpturings. While in some cases the eggs of moths are beautifully spotted and mottled, they are generally quite plain in color, white, pale green, bluish-green, or brown. Like the eggs of butterflies, they are provided with a micropyle. The micropyle, in the case of such eggs as are globular, conical, or cylindrical, is situated on top. In the case of those eggs which are flattened or lenticular, the micropyle is located on the outer margin or rim.

The eggs are always laid by the female in a state of freedom upon that food-plant which is most congenial to the larva. In captivity moths will often deposit their eggs in the receptacle in which they are confined. In such cases, unless the observer knows the food-plant upon which the species feeds, he will be apt to have great difficulty in rearing the larvae, unless by a happy chance he succeeds experimentally in ascertaining the proper plant. This may sometimes be done by introducing the leaves of a number of plants found in the neighborhood and observing those to which the young caterpillars resort.

The date of oviposition varies with different families and genera. Some moths deposit their eggs in the fall and the young insect passes the winter in the egg, emerging when the early springtime brings opening flowers and leaves. Some moths lay their eggs in the late summer and early fall; the eggs hatch shortly afterward, and the larvae, after molting one or more times, hibernate in the caterpillar state, and in the following spring resume the process of feeding and molting until such time as they are ready to undergo further transformation. Most
The Life-History and Anatomy of Moths

moths in temperate regions oviposit in the spring or early summer, and the eggs hatch shortly afterward.

THE CATERPILLARS OF MOTHS

The caterpillars of moths are of course extremely small when they first emerge from the egg. They, however, rapidly increase in relative size as they continue the process of feeding and molting, and in the case of some of the larger species become to the ignorant and uninformed even formidable in appearance. The larva of the Royal Walnut-moth, or "Hickory Horn-Devil," as it is sometimes called, is a striking object. (See Plate I, Fig. 4.) Specimens six and seven inches in length are not at all uncommon. With its curved horns and numerous spines it presents to the uninitiated a truly repellent aspect.

The larvae of the Heterocera, like those of the Rhopalocera, are principally phytophagous, that is to say, they feed upon vegetable matter. The food of the vast majority consists of the leaves of grasses, shrubs, and trees. A few larvae feed upon woody tissues, and bore long galleries under the bark or in the wood of trees. Others feed upon the pith of herbaceous plants. A number of species feed upon the inside of growing fruits. Only a very few species are known to be carnivorous. In Australia there occurs a Galleriid moth, the larva of which burrows into the fatty tissues of one of the great wood-boring caterpillars of the region, and preys upon it somewhat as is done by the great family of parasitic Hymenoptera, known to scientific men as the Ichneumonidae. Certain Phycids and Noctuids feed upon scale-insects, in the same way in which the larva of the butterfly known as *Penegeca tarquinius* feeds upon the same class of insects. Among the Tineidae there are certain species which, as is well known, feed upon hair and on horn. Every housewife is more or less acquainted with the ravages committed by the destructive larvae of the clothes-moth.

There is considerable variety in the form of heterocerous larvae, and still greater variety in the manner in which their bodies are adorned by various growths and colors. The body, as is the case with the larva of the Rhopalocera, is composed normally of thirteen rings or somites, anterior to which is the head.
The head is usually prominent, and is provided with mandibles, or jaws, eyes, rudimentary antennæ, maxillæ, palpi, and a spinneret for the production of silk. The head may be globular, hemispherical, or conoid. It is sometimes cleft on top, or bifid. It is generally more or less retractile, or capable of being drawn back, so as to be partially concealed in the folds of the anterior somite of the body.

Of the thirteen somites forming the body of the caterpillar, the three foremost are thoracic, and each is furnished with a pair of legs which correspond to the six legs of the perfect insect, or imago. The last two somites of the body are often so closely united with each other as to be superficially indistinguishable. The somites from the third to the eleventh inclusive are provided on either side with spiracles connecting with the tracheæ, through which the creature receives the external air in order to the oxidation of the waste products of the circulation.

![Fig. 4.—Larva of Hyloicus kalma: a, thoracic legs; b, prolegs; c, anal proleg; d, anal horn; e, head.](image)

The body is usually supported at the middle and at the end by prolegs, or false legs. In the majority of families there are four pairs of these prolegs, situated upon the sixth, seventh, eighth, and ninth somites, and a fifth pair situated on the thirteenth or last somite. The latter pair are called the anal prolegs. In the larva of the greater portion of the Geometridæ, and in those of numerous Noctuidæ, the prolegs are reduced in number, and in many of the Psychidæ they appear to be wholly wanting. In most of the Geometridæ the pair found on the ninth and thirteenth somites are the only prolegs, and therefore in order to progress the creature makes a series of movements in which the body is looped upward. These caterpillars are
known as "loopers" or "measuring-worms." When, as is the case with many genera of the *Noctuidae*, a less complete abortion of the prolegs occurs, and only a partial approximation to the movement employed by the larva of the *Geometridae* is witnessed, the caterpillars are said to be "half-loopers," or "semi-loopers." As examples of such caterpillars we may cite those belonging to the genus *Plusia*, in which there are only two pairs of abdominal prolegs. In the family of the *Megalopygidae* the prolegs are supplemented by sucker-like pads on the somites ranging from the fifth to the tenth, inclusive. In the *Cochlidiidae* the prolegs are wanting, their function being wholly assumed by such sucker-like pads, ranging on the ventral surface from the fourth to the eleventh somites, inclusive. In the *Eriocephalidae*, which are regarded as ancestral forms, there are, as has been pointed out by Dr. T. A. Chapman, eight pairs of abdominal prolegs and an abdominal sucker situated upon the ninth and tenth somites, having the shape of a clover leaf. These larva are further remarkable in having well-developed antennae.

After the larva have emerged from the egg and fed for a longer or shorter period, the outer skin, or epidermis, becomes too small to admit of further growth, and the insect then molts, or sheds its skin, and resumes feeding until increased development makes another molt necessary. The number of such molts varies in the case of different species. Ordinary, heterocerous caterpillars do not molt more than five times before transforming into pupae, but some genera molt as often as ten times, while others only molt thrice. The skin which is cast off preserves the outline not only of the body, but also of the horn-like processes, the hairs, and various other appendages attached to the body at the time of molting. The molting period is a critical time in the life of larva, and those who are endeavoring to rear them should never disturb them in the least at this time.

The bodies of the larva of moths are covered with tubercles, the location and arrangement of which has in recent years received considerable attention from students, and is thought to furnish a clue to the lines of descent of certain families. These tubercles sometimes carry only a single hair, in other cases they carry large tufts of hairs; they may be small and inconspicuous, or they may be developed until they assume the form of great
spines, horns, or bulbous projections. The hairs and spines with which some larvae are ornamented possess stinging properties. This is true of some genera among the *Saturniidae* and the *Cocclidiidae* in temperate America and of many genera in the same families and among the *Lasiocampidae* in the tropics. The stinging hairs of a large caterpillar found in tropical Africa are employed by the natives in preparing the poison which they put upon their arrows. The inflammation caused by these hairs, even in the case of specimens long dead, I know from personal experience to be very severe.

The coloration of caterpillars is often very striking and beautiful, and in most cases is such as to adapt them more or less to their surroundings in life. Cases of protective mimicry are very numerous. A beautiful illustration of this is seen on Plate I, fig. 15, where the singular form of the caterpillar, combined with its green tint, suggests the serrated edge of the leaf of the elm, upon which plant it feeds. There is almost endless diversity in the modifications of form and color in the larval stages of moths, and they are as characteristic as are the forms and colors of the perfect insects.

There is much diversity in the social habits of the larvae of moths. Some are gregarious and exist in colonies which disperse at the time of pupation; but there are a few singular instances, in which the communistic instinct perdures, and leads the entire colony to form a common cocoon, or envelope of silk, in which each individual subsequently spins a smaller cocoon for itself. In 1893 I had the pleasure of communicating some information in regard to this curious phase of insect life to the pages of the journal of the Cambridge Entomological Club (See Psyche, Vol. VI., p. 385). This habit is characteristic of certain genera of African moths, but has not thus far been observed as occurring in the case of any American species.

**THE PUPÆ OF MOTHS**

When the caterpillar has gone through its successive molts and attained to full development it undergoes the transformation known as pupation. From a life of freedom and motion it passes into a condition in which freedom and almost all power of motion are lost. The flexible and more or less agile body is
encased in hard chitinous rings and sheathings. As a measure of protection during this stage, the insect, before transforming into a pupa, descends into the earth, and forms there a cell at a greater or lesser depth beneath the surface, or else weaves a cocoon of silk about its body. In some cases the transformation takes place at the surface of the earth under leaves or under fallen branches and the loose bark of trees. In almost all such cases there is apparently an attempt, though often slight, to throw a few strands of silk about the body of the caterpillar, if only to hold in place the loose material amidst which transformation is to occur. The forms assumed in the pupal stage are not as remarkably diversified as in the larval or imaginal stages. The pupae of moths are generally brown or black in color, though a few are more or less variegated. The bright golden and silvery spots which ornament the pupae of many species of butterflies, causing them to be called chrysalids, are seldom, if ever, found.

While the change into a pupa might at first sight appear to the superficial observer to be disadvantageous because of the loss of motion and the imprisonment within narrow bounds, it nevertheless distinctly marks a progression in the life of the creature. The pupal case contains within it the moth, as may easily be ascertained by a careful dissection made in the very earliest period after the change has occurred, and which becomes very evident at a later time when the period of the pupal life is drawing to its close.

In the cocoon or in the cell in which pupation has taken place will always be found the exuviae, or the larval skin, etc., of the caterpillar, which have been cast off.

When the time comes for the perfect insect to emerge from the pupa, nature has provided methods by which escape from the prison cell underground, or the tightly woven cocoon, can be effected. In the case of those pupae which lie deeply buried
under the soil escape is made by means of the power possessed by the abdominal somites, or rings, of moving with a sort of spiral twist. The pupa "wriggles" itself upward through the soil until it reaches the surface, following in its course the line of least resistance, which is generally the line through which the larva burrowed downward to its hiding place. In this movement the pupae are often aided by spinous projections at the lower edge of the somites which prevent backward motion. When emergence from a cocoon occurs, the insect is provided with the power of ejecting from its mouth a fluid, which has the property of dissolving and cutting the silken threads. When the moth first emerges from the pupa its wings are soft and flabby and its body is long and vermiform. The first act is to secure a quiet resting place. The fluids of the body are in the process of circulation rapidly absorbed from the abdominal region, and, pressing outward under the action of the heart, cause the wings to expand and assume their normal form and the other parts to acquire adjustment. There is no more interesting spectacle than to witness the rapid development of a moth from its apparently helpless condition at emergence from the pupal stage into an insect strong of wing and often gloriously beautiful in color.

THE ANATOMY OF MOTHS

The body of all lepidoptera consists of three subdivisions, the head, the thorax, and the abdomen. The head bears the principal organs of sense and of nutrition, the thorax those of locomotion, and the abdomen those of generation and in large part those of assimilation, respiration, and circulation.

The reader who desires to ascertain the names and the function of the various organs of the body of moths may consult in this connection the corresponding portion of the "Butterfly Book," in which the principal facts have been fully set forth as to the diurnal lepidoptera. The anatomy of moths does not radically differ in its main outlines from that of the Rhopalocera. The same names are applied to the parts, and the differences which occur are not so much differences in function as in outline.

In studying the head of moths we find that as a rule the head is not as prominent as is the case in butterflies. It is more retracted, as a rule, though in the case of some families,
as the *Sphingidae*, it is produced well in advance of the thorax, but even in such cases it is generally more solidly attached to the anterior part of the thorax and is less mobile than in the butterflies.

The suctorial apparatus is formed in the moths as in the case of the butterflies by the peculiar modification of the maxilla into semi-cylindrical and interlocking tubes forming the *proboscis*. This is enormously produced in some groups, enabling the insect to hover upon the wing over flowers and rob their cups of the honey which they contain. This is especially true of the *Sphingidae* and some subfamilies of the *Noctuidae*. In other cases, as in the family of the *Saturniidae* and *Bombycidae*, the proboscis is very feebly developed or aborted. In fact, we know that some of these creatures are without mouths and that they do not partake of nourishment in the winged state. They are simply animate, winged reservoirs of reproductive energy, and, when the sexual functions have been completed, they die.

The eyes of moths are often greatly developed. This is especially true of those species which are crepuscular in their habits. The eyes of the heterocera are, as in all other insects, compound. They may be naked, or may be more or less studded with hairs, or lashes, projecting from points lying at the juncture of the various facets making up the organ. This fact has been utilized to some extent in classification. Ocelli, or minute simple eyes, subsidiary to the large compound eyes, occur in some forms, just above the latter, but are generally so concealed by the covering of the head as to be only recognizable by an expert observer.

The labial palpi of moths, as of butterflies, consist of three joints, but there is far greater diversity in the development of the palpi among the moths than among the butterflies. In some
cases they are but very feebly developed, in others they attain relatively enormous proportions and strangely eccentric forms. Maxillary palpi are found in some groups. The maxillary palpi have two joints.

The antennae of moths, which, as has already been pointed out, differ greatly in form from those of butterflies, are attached to the head in the same relative location as in butterflies. Antennae may be filiform, threadlike, fusiform, spindle-shaped, or dilate, more or less swollen toward the tip. They may be simple, i.e., without lateral projections, but this is rarely the case. The shaft may be set with cilia, or small hair-like projections on the side of the joints. Such antennae are said to be ciliate. Sometimes instead of cilia we find bristle-shaped projections on the joints. These are called setose antennae. In some forms both cilia and bristles occur on the antennae. When the bristles are arranged in clusters on the joints of the antennae they are said to be fasciculate. Many forms have tooth-like projections on the antennae; in such cases the antennae are described as den-
late. The form and arrangement of the joints may be such as to suggest the teeth of a saw; such antennæ are said to be serrate. When on the lower side of the joints of the antennæ there are minute plate-like projections, the antennæ are described as lamellate. Many moths have pectinate antennæ, the projections resembling little combs, which may be arranged singly or in pairs on each joint. Occasionally, but not often, there are two pairs of such appendages on each joint. When the pectination is excessive, so as to cause the antennæ to resemble a feather, they are said to be plumose. Figures 9 and 10 illustrate some of these forms. In addition to the peculiarities which have just been mentioned, antennæ may be variously adorned with scales, especially upon the upper side of the shaft, and they may be notched, or provided with knot-like enlargements, in which case they are said to be nodose, or they may be curved, or bent in peculiar ways, when they are described as sinuate.

The thorax, as in butterflies, consists of three segments, the prothorax, the mesothorax, and the metathorax. The prothorax bears the tegulae or collar-lappets, the patagia, or shoulder-lappets, and the anterior pair of legs. The mesothorax carries the second pair of legs and the fore wings. The metathorax the last pair of legs and the hind wings.

The abdomen, just as in butterflies, is normally composed of nine segments, though the modifications of the terminal segments are often such as to make it difficult to recognize so many. At the base of the thorax is situated a pair of large tracheal spiracles, and on the other segments pairs of smaller spiracles. Through these spiracles respiration is carried on. At the end of the abdomen, more or less concealed by variously arranged tufts of hair, are the organs of generation, which have in recent years been studied quite closely by a few authors and are useful in distinguishing species.

The legs of moths are composed of coxa, trochanter, femur, tibia, and tarsus, the latter composed of five joints, and armed at its end with two more or less developed hooks, or claws, known technically as the ungues, and also a pulvillus, or pad, just back of the claws on the lower side. The legs are armed with spines and spurs, and there are different sexual appendages in the males of various genera. The cut (Figure 11) shows the structure
of the legs. It will be well for the student to thoroughly familiarize himself with the location and names of the different parts indicated in this and the following figure.

\[\text{Fig. 11.—Legs of a Moth. (From “Packard's Guide,” p. 231.)}\]

1. **Fore Leg.**

   - s\(p\). Paired medial spurs.

3. **Hind Leg.**
   - u. Ungues.
   - p. Pulvillus.
   - s\(p\). Two pairs of posterior spurs.

The structure of the wings of moths is essentially like that of butterflies, and consists of a framework of hollow tubes which support a double membrane which bears upon its surfaces the scales, which overlap each other like the tiles upon the roof of a house. The tubes, which are known as veins, communicate with the respiratory system and are highly pneumatic. They are also connected with the circulatory system, and are furnished, at least through their basal portions, with nerves.

The fore wing has normally twelve veins. The hind wing has also in primitive forms, as the *Hepialidae*, twelve veins, but in the vast majority of cases this number has been reduced, and eight veins is the number which is found in the majority of cases in the hind wing. The accompanying figures, with their explanations, will suffice far better than any mere verbal explanation to explain the structure of the wings of moths. (See Figures 12 and 13.)

The relative position of vein five in relation to the median or subcostal systems has been much utilized in recent years by systematists in their classification of the various groups.
The Life-History and Anatomy of Moths

The fore and hind wings in some of the primitive forms are not connected with each other in the operation of flight. In the Hepialidae there is a lobe near the base of the primaries which is known as the jugum, but it does not appear to serve the practical functions of a yoke. This is illustrated in Figure 13. In the vast majority of cases a connection between the fore and hind wings is made by means of the frenulum on the hind wing, which hooks into the retinaculum upon the fore wing, as illustrated in Figure 14. The form of the frenulum is of use in determining the sex of specimens, as in the case of the males it consists of a single curved, hook-like projection, whereas in the case of the females it is split up into a number of bristles. However, in some

 7. Subcostal nervure of hind wing.
groups, as the *Phycitina*, the frenulum is simple in both sexes. In some of the families the frenulum is aborted, and its function is assumed by a lobe-like expansion of the basal portion of costa of the hind wing. The nomenclature of the parts of the wings of moths is not essentially different from that which is employed in describing the wings of butterflies. There are, however, certain conventional terms which have been applied by authors to the markings upon the wings, especially of the *Noctuidae*, and Figure 15 will serve to explain and illustrate these terms.

A great deal of useful information in regard to the anatomical structure of the Lepidoptera, and of moths in particular, may be derived from the study of various manuals and special papers, reference to which will be made hereafter as the various families are successively taken up and studied.

Among works to be particularly recommended in this connection are those of Professor A. S. Packard and Professor Comstock's "Manual for the Study of Insects." A very useful treatise is found in Professor David Sharp's two volumes upon the *Insecta* contained in the "Cambridge Natural History." Every student, as he advances in the study of the subject, will have frequent occasion to consult these useful books, which embody the results of the most recent researches and are invaluable for purposes of
reference. An even more valuable work than these is the great "Catalogue of the Lepidoptera Phalaenae contained in the Collection of the British Museum," which is being prepared by Sir George F. Hampson, and published by the Trustees. The endeavor in this work is to give a complete view of the entire subject in compact form, and the learned author has enlisted the coöperation of the most distinguished lepidopterists throughout the world in the prosecution of his great task. The work is of course somewhat expensive, but the working lepidopterist cannot well do without it. Much help may also be derived from the older works of Burmeister and Westwood, which, though old, are far from being obsolete and useless.
CHAPTER II

THE CAPTURE, PREPARATION, AND PRESERVATION OF SPECIMENS

“Does he who searches Nature’s secrets scruple
To stick a pin into an insect?”

A. G. OEHLENSCHLÄGER, Aladdin’s Lamp.

Everything that has been said in “The Butterfly Book” in reference to the capture, preparation, and preservation of specimens holds good in the case of the Heterocera. Inasmuch, however, as many of the moths are exceedingly minute in form, it is worth while to state that a greater degree of care must be observed in the collection and preservation of these minute species than is necessary in the case of even the smallest butterflies. The best method of collecting the micro-lepidoptera is to put them, after they have been netted, into pill-boxes, which have glass covers, or into vials or test tubes of large size. These receptacles may be carried in a bag or pocket by the collector. When he has returned from the field, the specimens may be killed by subjecting them to the action of sulphuric ether applied to the corks of the vials, or introduced into the boxes on a camel’s-hair pencil. By dipping the cork into the ether and moistening it with a drop or two and then replacing it in the vial the insect is stunned. Sometimes two or three successive applications of ether are necessary. When the insect has been killed and is still lax, it is fixed upon a small silver pin of a size proportionate to that of its body, and is then transferred to the setting board. Setting boards for mounting micro-lepidoptera should be made
The Capture, Preparation, and Preservation of Specimens

differently from setting boards commonly used for butterflies and larger moths. The best form known to the writer is one, which has for many years been employed by Mr. Herbert H. Smith, the veteran collector. Small pieces of glass about one inch square, with their edges very lightly beveled, so as to remove all sharpness, are spaced upon a strip of cork fastened to a wide piece of soft pine in such a way that an interval of from one-sixteenth to one-eighth of an inch occurs between them. This serves as the groove to receive the body of the specimen. Having been fixed upon the pin the insect is placed in one of these grooves. The wings are then carefully expanded with a crooked needle fastened in a handle, as illustrated in Figure 16, and are then bound in place by a thread which is held in place by a pin, as shown in Figure 17. Though the wings of these small insects may, when mounted, at first curl up a little under the pressure of the thread drawn across them, they generally recover their position after removal from the setting board. The advantage of mounting these insects upon glass arises from the fact that the sharp point of the needle will glide over the glass and the surface is smooth.

Fig. 17.—Setting board for mounting micro-lepidoptera; \(a\), pieces of glass attached to papered cork with shellac; \(b\), base of soft pine; \(co\), cork; \(d\), white paper covering cork; \(ee\), brads, to which setting threads are tied; \(ff\), pins set firmly beyond groove to secure alignment of setting threads; \(ii\), setting threads; \(pp\), pins to which setting threads are fastened, and which are stuck into the pine base to hold down the wings in position; \(h\), small silver pin transfixing thorax of specimen.
The Capture, Preparation, and Preservation of Specimens

so that they are not torn, nor are the fringes and other delicate portions injured. In doing this work it is best to use a reading-glass mounted in a frame, so that the operator can see the objects before him magnified two or three diameters. The mounting of micro-lepidoptera taken in the field and put into envelopes, as often has to be done, is a very trying operation. After the insects have been sufficiently dried they may be set up as double mounts, the small silver pins being thrust through pieces of pith held upon a larger pin. The Pyralidae, the Tortricidae and all the smaller micro-lepidoptera should, if possible, be collected in the way which has just been described, and it is only thus that specimens worthy of installation in a well ordered cabinet can be secured.

Larger forms may be placed in envelopes if intended to be transmitted to great distances prior to study. Larvae may be inflated in the manner described in "The Butterfly Book." In all other particulars the directions contained in that volume may be safely followed by the student.

"As the moths around a taper,
As the bees around a rose,
As the gnats around a vapour,
So the spirits group and close
Round about a holy childhood, as if drinking its repose."

E. B. Browning, A Child Asleep.
CHAPTER III

THE CLASSIFICATION OF MOTHS

"The filmy shapes that haunt the dusk."

Tennyson, In Memoriam, xciii.

The insects of to-day, like the animals of all other classes found upon the globe, represent lines of descent from an ancestry, which runs back into the remote geologic past. The attempt to trace the lines of descent in any order by studying the resemblance between genera and species as they exist to-day, while throwing considerable light upon the subject, can never yield wholly satisfactory results in the absence of testimony derived from the field of paleontological inquiry. The study of fossil insect life is as necessary to elucidate the story of the development of the insect world, as the study of fossil vertebrates is necessary in order to understand the manner in which existing mammals have been derived from preexisting forms. At best descent can only be positively asserted within the lines of those groups, to which naturalists have given the name of families. Within these it is possible to declare of this or that genus that it has been possibly, or even probably, derived from the same stock as another. Reference to a common ancestral form may safely be predicated of very few families, so far as such assertion of a common parentage rests upon evidences found in the living structures of to-day.

All attempts to classify the lepidoptera in such a manner as to show the derivation of one of the existing families from another, and to maintain a lineal sequence in the order given, must necessarily prove wholly disappointing. The fact is, that the various families represent divergences from the parent stem, which may be likened to the divergence of the branches from the trunk of a tree. Any system of classification, which leaves this
fact out of sight, is necessarily defective, and as unnatural as it would be for a man to lop off the branches of a tree, and then, laying them down side by side, declare, as he contemplated the result of his labors, "This is a tree scientifically arranged." Inasmuch, however, as in books and cabinets serial order must be preserved, the best that the student can do is to collate those forms, which display some traces of likeness, and give some hint of their common origin.

Exceedingly different views have been entertained by naturalists in recent years in reference to the matters which we are discussing, and various schemes of systematic arrangement have been evolved, many of which are contradictory, and not a few of which appear to the unprejudiced to be more ingenious than natural. Inasmuch as this book is intended for the use not so much of advanced students, as of those who are entering upon the study of the subject, it does not seem to the writer worth while to encumber these pages with what would necessarily be a lengthy recital of the various schemes for classification to which he has alluded. He is inclined to regard the scheme which has been adopted by Sir George F. Hampson in the preparation of his great work upon the moths of the world, which is now being issued by the Trustees of the British Museum, as upon the whole as satisfactory as any which has recently been evolved. Inasmuch, however, as Dr. Harrison G. Dyar has quite recently published a List of the Lepidoptera of the United States, which is certain for many years to come to be used very largely by American students in arranging their collections, it has seemed upon the whole to be best to conform the text of the present volume to the serial arrangement given in Dr. Dyar's List, although the writer differs very positively from the learned author of that work in his views as to the position which should be held in relation to each other of a number of genera. The last word in reference to the classification of the insects contained in this group has certainly not yet been spoken by any one, and we are very far from having attained in our studies to conclusions which may be accepted as final.

For the assistance of students the writer herewith gives a key to the families which are represented in this book, which is based upon the key given by Sir George F. Hampson in the first
The Classification of Moths

volume of his "Catalogue of the Lepidoptera Phalænae," and in the preparation of which he has been assisted by Dr. Dyar.

KEY TO THE FAMILIES OF NORTH AMERICAN HETEROCERA.

Antennæ not clubbed or dilated, or frenulum present when clubbed or dilated. Frenulum present when not otherwise indicated...

1—Hind wing with cell emitting not more than six veins; wings unlike in shape...

2—Hind wing with cell emitting more than six veins; wings similar in shape..

3—Fore wing with vein 1c absent.

22

5—Fore wing with vein 5 nearer 4 than 6.

4—Hind wing with vein 8 absent.

Fam. 4, Syntomidae.

5—Hind wing with vein 8 present.

Fam. 5, Lithosiidae.

6—Hind wing with vein 8 remote from 7.

Hind wing with vein 8 touching or approximate to 7 beyond cell...

7—Hind wing with vein 8 anastomosing with cell to near or beyond middle.

Hind wing with vein 8 anastomosing with cell near base only.

8—Fore wing with tufts of raised scales in the cell.

Fam. 20, Nolidae.

9—Antennæ with shaft more or less dilated toward tip.

Antennæ with shaft not dilated.

10—Hind wing with veins 3 and 4 stalked...

Fam. 10, Pericopidae.

11—Fore wing with costa and inner margin parallel, arched at base...

Fam. 9, Nycteolidae.

12—Hind wing with vein 1a absent or not reaching anal angle...

Fam. 17, Platypireyidae.

13—Frenulum present...

Fam. 28, Thyrididae.

14—Hind wing with vein 8 diverging from cell from base...

Fam. 2, Saturniidae.

15—Tongue absent; no tibial spurs; frenulum absent...

Fam. 3, Ceratocampidae.
The Classification of Moths

16—Hind wing with vein 8, remote from 7 .......................... 17
   Hind wing with vein 8 approximated to or united with 7 .... 21
17—Proboscis absent; frenulum absent ......... Fam. 16, Bombycidae.
   Proboscis present ........................................... 18
18—Hind wing with vein 8 joined to cell to near middle; vein 5 weak
   Hind wing with vein 8 joined to cell near base only or vein 5
   strong ............................................................ 19
19—Fore wing with veins 3 and 4 separate ........................... 20
   Fore wing with veins 3 and 4 stalked ............ Fam. 11, Diociptidae.
20—Fore wing with vein 8 stalked with 9 .... Fam. 19, Epirhomenidae.
   Fore wing with vein 8 not stalked with 9 .... Fam. 18, Geometridae.
21—Hind wing with vein 8 joined to cell by a bar ..... Fam. 1, Sphingidae.
   Hind wing with vein 8 not joined to cell by a bar, Fam. 13, Thyatiridae.
22—Wings divided into plumes ...................................... 23
   Wings not divided into plumes ............................ 24
23—Fore wing divided into four plumes .... Fam. 32, Pierophoridae.
   Fore wing divided into six plumes .......... Fam. 33, Orneodidae.
24—Hind wing with vein 8 absent .............................. Fam. 30, Aegeriidae.
   Hind wing with vein 8 present ............................... 25
25—Fore wing with vein 5 from middle of discocellulars or nearer 6 than 4
   .......... Fam. 21, Lacosomidae ............................ 26
26—Hind wing with vein 8 anastomosing with or closely approximated
   to vein 7 .... ..... Fam. 31, Pyralidae.
   Hind wing with vein 8 remote from 7 ........ 27
   Vein 8 free or united to cell by a bar ................... 28
28—Hind wing with vein 8 joined to cell to middle; fore wing with a
   branch to vein 1 below ............ Fam. 24, Megalopygidae.
   Hind wing with vein 8 joined to cell at base; no branch to vein
   1 below .......... Fam. 23, Cochliidiidae .......................... 30
29—Mid spurs of hind tibiae very short or absent ............ 31
   Mid spurs of hind tibiae, or at least one, well developed .... 34
30—Proboscis absent ................................................ 31
   Proboscis present; vein 8 joined to the cell by a bar
   ................................................................. 32
   Female winged ................................................. 32
   Female not winged .... Fam. 22, Psychidae .......................... 33
32—Abdomen extending beyond hind wings ........... Fam. 29, Cossidae.
   Abdomen not extending beyond hind wings ........ 33
33—Antennae short; larvae free ........ Fam. 25, Dalceridae.
   Antennae long as usual; larvae parasitic .... Fam. 26, Epipypopidae.
34—Palpi obtuse ................................................. 34
   Palpi more or less acute ....................... Fam. 34, Tortricididae.
35—Head at least partly roughly haired .......... Fam. 41, Tineidae (part).
   Head smooth, or with loosely appressed scales ........ 36
The Classification of Moths

36—Antennae with basal eye-cap.............. Fam. 41, Tineidae (part).
    Antennae without basal eye-cap.................... 37
37—Maxillary palpi developed..................... 38
    Maxillary palpi rudimentary...................... 39
38—Fore wing with vein 7 to outer margin........ Fam. 35, Yponomeutidae (part).
    Fore wing with vein 7 to costa................. Fam. 41, Tineidae (part).
39—Hind wing with vein 8 more or less distinctly connected with cell; outer margin usually sinuate........ 40
    Hind wing with vein 8 not connected with cell..... 41
40—Fore wing with vein 7 to outer margin or apex
    Fam. 37, Xylorictidae.
    Fore wing with vein 7 to costa................. Fam. 36, Gelechiidae.
41—Hind wing with veins 6 and 7 nearly parallel.................. 42
    Hind wing with veins 6 and 7 approximated or stalked........ 43
42—Posterior tibiae hairy...................... Fam. 38, Cærophoridae.
    Posterior tibiae smooth..................... Fam. 39, Blastobasidae.
43—Hind wing elongated ovate, longer than fore wings
    Fam. 35, Yponomeutidae (part).
    Hind wing lanceolate or linear, shorter than forewings...
    Fam. 40, Elachistidae.
44—Maxillary palpi and tibial spurs absent...... Fam. 42, Hepialidae.
    Maxillary palpi and tibial spurs developed..... Fam. 43, Micropterygidae.

* No good character has been shown at present for the separation of the Cærophoridae and the Blastobasidae.
CHAPTER IV

BOOKS ABOUT NORTH AMERICAN MOTH

The literature of our subject is quite extensive, and the most important portions of it are contained in the publications of various learned societies and institutions.

The first references to the subject are found in the writings of Linnaeus, Johanssen, Clerck, Fabricius, Cramer, Hübner, Geyer, Drury and John Abbot. The works of Clerck, Cramer, Hübner, Geyer and Drury are all illustrated, and contain figures of many of the more showy North American species. Abbot and Smith’s “Rarer Lepidopterous Insects of Georgia” gives figures of a number of moths, with their larvae and food-plants.

In 1841 the work of Dr. Thaddeus William Harris, entitled “A Report on the Insects of Massachusetts which are Injurious to Vegetation,” was published. This was followed in 1852 by the work of A. Guenée on the Noctuelites, the Deltoides, and the Pyralites, constituting Volumes V.-VIII. of the “Spécies Général des Lépidoptères,” forming a portion of the “Suites à Buffon.” Many North American species were here described for the first time, and some of them were figured in the Atlas of Plates accompanying the work. In 1850 G. A. W. Herrich-Schäffer of Ratisbon began the publication of his “Sammlung Neuer oder Wenig Bekannter Aussereuropäischer Schmetterlinge,” which, appearing in parts, was not completed until 1869. Good figures of a number of North American moths are contained in this important volume. In 1854 Francis Walker began the publication under the authority of the Trustees of the British Museum of his “List of the Specimens of Lepidopterous Insects in the Collection of the British Museum.” This work, which finally grew to thirty-five volumes, the last of which appeared
Books about North American Moths

in 1866, contains descriptions of a multitude of moths found within the United States and Canada. Unfortunately Walker's descriptions are not always recognizable, and his classification as to families and genera was at times very careless. In 1859 Brackenridge Clemens published in the Journal of the Academy of Natural Sciences of Philadelphia, Vol. IV., pp. 97-190, a "Synopsis of the North American Sphingides." In 1860 the Smithsonian Institution issued a "Catalogue of the Described Lepidoptera of North America," compiled by the Rev. J. G. Morris. This catalogue, which was the first to appear, is now antiquated. In 1862 the same institution published a book by the same author, entitled "A Synopsis of the Described Lepidoptera of North America." It is almost wholly a compilation. The first part is devoted to the butterflies of the region. From pp. 122-314 the book is devoted to descriptions of the moths, principally extracted from the writings of Harris, Clemens, and Walker, and these are continued in the Supplement, pp. 330-350. The work is not wholly without value.

This brief review of the literature issued previous to the outbreak of the great Civil War in America, covers practically everything of importance upon the subject which had appeared up to that time. The period which has followed has been characterized by greater activity in all scientific directions, and the principal works which have appeared upon the moths of the United States during the past forty years are herewith given in a list, which, while not by any means complete, is sufficiently full to enable the student to ascertain where to find information for the prosecution of his studies, when he shall have acquainted himself with the contents of this volume.

PERIODICALS CONTAINING MUCH INFORMATION IN REGARD TO THE MOTHS OF NORTH AMERICA

Bulletins of the U. S. Department of Agriculture (Division of Entomology). (Published occasionally.)

Books about North American Moths

Entomological News, Vols. I–XIII, 1890–1903, Philadelphia Academy of Natural Sciences. (Published monthly, except July and August.)

Proceedings of the Entomological Society of Washington, Vols. I–V, 1890–1903. (Published occasionally.)

GENERAL CATALOGUES AND LISTS

BROOKLYN ENTOMOLOGICAL SOCIETY Check List of the Macro-Lepidoptera of America, North of Mexico (Brooklyn, 1882, pp. 1–25).

GENERAL WORKS CONTAINING INFORMATION AS TO THE MOTHES OF NORTH AMERICA

BUSCK, A.

"When simple curiosity passes into the love of knowledge as such, and the gratification of the aesthetic sense of the beauty of completeness and accuracy seems more desirably than the easy idleness of ignorance; when the finding out of the causes of things becomes a source of joy, and he is counted happy who is successful in the search, common knowledge of Nature passes into what our forefathers called Natural History, from whence there is but a step to that which used to be termed Natural Philosophy, and now passes by the name of Physical Science."—THOMAS HENRY HUXLEY, in The Crayfish.
THE MOTHs OF NORTH AMERICA,
NORTH OF MEXICO
"The laugh at entomology is nearly spent. Known professors of the science, and members of its 'Society,' may now assemble in council and communicate their observations and inquiries without fear of becoming themselves subjects for a commission de lunatico inquirendo, and butterfly hunters, net in hand, may now chase their game without being themselves made game of."—Acheta Domestica.
ORDER LEPIDOPTERA

SUBORDER HETEROCERA (MOTHS)

FAMILY 1.

THE SPHINGIDÆ (HAWKMOTHS)

"The Sphinx is drowsy,
Her wings are furled."—EMERSON.

The moths composing this family vary greatly in size. Some African species are very little more than an inch in expanse of wings. Those which occur in North America are medium-sized or large.

The body is relatively very stout, the abdomen conic, cylindric, or flattened on the ventral surface, always protruding far beyond the hind margin of the secondaries, sometimes adorned with lateral or terminal tufts capable of expansion. The thorax is stout and often advanced beyond the insertion of the wings. The head is large and generally prominent. The eyes are often large, prominent, and generally naked, never hairy. The palpi are well, but never excessively, developed. The proboscis is generally long, sometimes much longer than the body, but in a few genera among the Ambulicinæ greatly reduced and even obsolete. The antennæ are well developed, stouter in the male than in the female sex, thickening from the base to the middle, or in some genera to nearly the end, usually hooked at the extremity, sometimes merely curved. The joints of the antennæ in the case of the males of some of the subfamilies are equipped at either end with peculiarly arranged fascicles of projecting hairs, or cilia, the arrangement

Fig. 20.—Greatly magnified view of the under side of three joints of the antenna of P. quinquemaculatus.
of which, as examined under the microscope, is seen to be quite different from that which prevails in any other family of moths. The accompanying illustration (Fig. 20) shows this arrangement in the case of the common Five-spotted Hawkmoth, *Protoparce quinquemaculatus*.

The wings are small in comparison with the body. The front wings are very long in proportion to their width, and the costal veins are always very stoutly developed. The tip of the wing is usually pointed, and the margins are straight or evenly rounded, though in some genera, principally belonging to the subfamily *Ambulicinae*, they have undulated or scalloped margins. The hind margin of the fore wings is always much shorter than the costal margin. The hind wings are relatively quite small. The venation of the wings is characteristic. The primaries have from eleven to twelve veins, the secondaries eight, reckoning the two internal veins, veins 1a and 1b, as one. Veins eight and seven are connected near the base of the wing by a short vein, or bar. The discal cell is relatively quite small in both wings. There is always a frenulum, though in the *Ambulicinae* it is frequently merely vestigial. The general style of the venation is illustrated in Figure 21, which represents the structure of the wings of *Sesia tantalus* Linnaeus. The hawkmoths have prodigious power of flight. A few genera are diurnal in their habits; most of them are crepuscular, flying in the dusk of evening, a few also about dawn.

The larvae are usually large. There is great variety in their color, though the majority of the North American species are of some shade of green. They usually have oblique stripes on their sides, and most of them have a caudal horn, which in the last stages in some genera is transformed into a lenticular tubercle. In a few genera the anal horn is wanting. The anterior segments of the bodies of the larvae are retractile. When in motion the body is long and fusiform, but when at rest the head and the anterior segments are drawn back, the rings
EXPLANATION OF PLATE II

(The specimens figured are contained in the collection of W. J. Holland.)

1. *Hamorrhagia thetis* Boisduval, ♂.
2. *Hamorrhagia tenuis* Grote, ♀.
5. *Hamorrhagia thysbe* Fabricius, ♂.
15. *Deidamia inscriptum* Harris, ♂.
20. *Celerio intermedia* Kirby, ♀.
“telescoping” into one another, and the anterior portion of the body being often raised, as illustrated in Plate I, Figure 1. It is alleged that the habit of assuming this posture, suggesting a resemblance to the Egyptian Sphinx, prompted the application of the name to these creatures. The larvæ are not gregarious, but feed solitarily upon their appropriate food-plants.

Some forms pupate in a cell deep under the soil, others spin a loose cocoon among damp fallen leaves and pupate at the surface. The pupæ are as remarkable as the larvæ. A few genera have the proboscis enclosed in a sheath which is separate along the greater portion of its course from the adjacent wall of the body. This is illustrated in Figure 22.

![Fig. 22.—Pupa of Protoparce quinquemaculatus. (After Riley.)](image)

The Hawkmoths of the United States and Canada fall into five subfamilies, the Acherontiinae, the Ambulicinae, the Sesiinae, the Philampelinae, and the Chaerocampinae.

**SUBFAMILY ACHERONTIINÆ**

**Genus HERSE Oken**

(1) *Herse cingulata* Fabricius, Plate VI, Fig. 3, 8, (The Pinkspotted Hawkmoth.)

Syn. *convolvuli*, var. Merian; *affinis* Goeze; *druræi* Donovan; *pungens* Eschsholtz; *decolora* Henry Edwards.

This large and elegant hawkmoth, the larva of which feeds upon sweet-potato vines and various other *Convolvulaceæ*, has been confounded by writers with *H. convolvuli* Linnaeus, which it resembles, but from which it is abundantly distinct. The latter species is confined to the old world. *H. cingulata*, the only species of the genus occurring in the western hemisphere, ranges from Canada to northern Patagonia, and is also found in the Galapagos and Sandwich Islands. I have a specimen taken at sea in the Atlantic, five hundred miles from the nearest land.
Sphingidae

It settled in the cabin of a ship and was caught by the captain of the vessel.

Genus COCYTIUS Hübner

The genus Cocytius, which includes some of the largest hawkmoths which are known, contains five species, all of which are found in the tropics of the new world. They may easily be recognized by the fact that the third joint of the labial palpi is in both sexes prolonged into a small, sharp, conical, naked horn. The larvae, which feed upon the Anonaceae, are covered with fine hairs. Only one of the species is found within the faunal limits covered by the present work. It occurs in southern Florida, and in southern Texas as a straggler.

(1) Cocytius antaeus Drury, Plate VI, Fig. 1, ♀. (The Giant Sphinx.)

Syn. carica Müller (non Linnaeus); jatropha Fabricius; hydaspus Cramer; medor Stoll; anon Shaw; tapayusa Moore.

The species is somewhat variable, specimens from the Antilles being often lighter in color than those from Central America, and the continental portions of its habitat. This lighter form is accepted by Rothschild & Jordan as typical, and the darker form is called by them Cocytius antaeus medor Stoll. The difference is hardly sufficiently constant to justify the separation into two subspecies. The insect ranges from Florida into southern Brazil.

Genus PROTOPARCE Burmeister

The head is prominent. The body is stout and heavy. The tongue in both sexes is at least as long as the body. The palpi are large, ascending, and appressed to the front, having the basal joint long, the second a little shorter, but broader, and the terminal joint minute. The eyes are large, feebly lashed. The tibiae are either without spines, or feebly armed with minute spinules. The mid tarsus is provided with a comb of long bristles. The venation of the wings is typically spongi-form. The outer margins of the primaries are evenly rounded. There is a slight projection of the secondaries at the extremity of vein 1b. The prevalent colors of the wings are shades of gray, banded and mottled with darker and lighter lines and
Sphingidae

spots. The abdomen is generally marked on the sides by rows of yellowish spots.

The larvæ are cylindrical with the head rounded. The anal horn curves downward and is granulose. The prevalent colors are shades of green. The segments, from four to eleven inclusive, are marked on the sides with whitish diagonal stripes.

The pupa has the tongue-case free, curved, and nearly touching the pectus.

This genus, which is confined to the two Americas, includes thirty species, of which four occur within our faunal limits.

(1) **Protoparce sexta** Johanssen, Plate IV, Fig. 2, ♀. (The Tomato Sphinx.)

*Syn. carolina* Linnaeus; *nicotiana* Ménétrier; *lycopersici* Boisduval.

This is one of our commonest hawkmoths. Its larva feeds upon the potato, tomato, and other *Solanaceae*. It ranges over the United States and is represented in Central and South America by several subspecies or local races.

(2) **Protoparce quinquemaculatus** Haworth, Plate IV, Fig. 1, ♀. See also text figures 20 and 22. (The Five-spotted Hawkmoth.)

*Syn. celeus* Hübner; *carolina* Donovan.

Like the preceding species, this hawkmoth is very common. Its larva feeds upon the *Solanaceae* and is particularly destructive to tobacco. It is familiarly known in the South as the "tobacco fly."

(3) **Protoparce occulta** Rothschild & Jordan, Plate IV, Fig. 4, ♀. (The Occult Sphinx.)

This hawkmoth is found in a number of American collections confounded with *P. sexta = carolina* Linnaeus. It may readily be distinguished by the different markings of the hind wings, the absence of the two rows of small white spots on the back of the abdomen, and by the small but conspicuous whitish dot at the end of the cell of the fore wing. It occurs in Texas and Arizona and ranges southward to Central America. Its larval habits are not known.

(4) **Protoparce rustica** Fabricius, Plate VII, Fig. 5, ♀. (The Rustic Sphinx.)

*Syn. chionanthi* Abbot & Smith.

The caterpillar of this hawkmoth feeds upon the fringe-bush
Sphingidae

(Chionanthus) and the jasmine. It is a common species in the southern States and Central America, but is only occasionally found in the northern States. I have not infrequently taken specimens in southern Indiana, and it is now and then captured in Pennsylvania and even in New England.

Genus CHLÆNOGRAMMA Smith

This genus, which is very closely allied to the preceding, may be distinguished from it by the fact that the comb of long bristles of the mid tarsus, which is characteristic of Protoparce, is wanting or reduced to at most one or two bristles. Pulvillus and paronychium present. The eyes are smaller than in Protoparce, and are not lashed. There are two species in the genus, one South American, the other found in the eastern portion of the United States.

(1) Chlænogramma jasminearum Guérin, Plate VII, Fig. 6, ♂. (The Ash Sphinx.)

Syn. rotundata Rothschild.

The larva of this hawkmoth feeds upon the various species of ash (Fraxinus). It is found in the middle Atlantic States and southward, and ranges as far west as the Mississippi.

Genus DOLBA Walker

Head small; eyes small and lashed. The antennæ are fusiform with a short abrupt hook at the tip. The tibiae are not spinose. The mid tarsus has a comb.

The genus, which contains but a single species, is differentiated from all those in which the eyes are lashed by the non-spinose tibiae.

(1) Dolba hylæus Drury, Plate VI, Fig. 4, ♂. (The Papaw Sphinx.)

This small, but neatly colored hawkmoth, may readily be distinguished by the figure given in our plate. Its larva, which is green, marked with lateral oblique red bands, commonly feeds upon the papaw, (Asimina triloba), and is generally abundant where that plant is common, as in the Valley of the Ohio. It is also said to feed upon Prinos. It ranges from Canada to the Gulf States and westward to Iowa and Missouri.

46
Genus ISOGRAMMA Rothschild & Jordan

This genus has been erected by Rothschild & Jordan for the reception of the single species which we figure. The learned authors say: “In the shortness of the fore tibia and first segment of the fore tarsus the only species of this genus agrees with the species of Ceratomia, and in the preservation of the pulvillus with Chlænogramma, while it differs from both genera in the fore tibia and the extreme apex of the mid tibia being armed with spines. The spinosity of the tibia is an advanced character, not acquired by Ceratomia, while the pulvillus is an ancestral structure already lost in Ceratomia.”

(1) Isogramma hageni Grote, Plate IV, Fig. 8, ♂. (Hagen’s Sphinx.)

This obscurely colored hawkmoth, which is liable to be confounded with some of the species of Ceratomia, which it superficially resembles, may be distinguished at a glance by the slightly greenish shade of the primaries and by the absence of the dark-brown border of the hind wings, which is characteristic of all the species of Ceratomia. It occurs in Texas.

Genus CERATOMIA Harris

The tongue is reduced in size. The palpi are small. The eyes are small. The tibiae are unarmed. There is no comb of bristles on the mid tarsus, the pulvillus is absent, the paronychium is present. The primaries are relatively large with evenly rounded outer margin. The secondaries are slightly produced at the end of vein 1b.

The species have dissimilar larvae. In the case of amyntor the larva has four horn-like projections on the thoracic segments; in the case of the other two species of the genus the larvae are distinctly and normally sphingiform.

The tongue-case of the pupa is not projecting.

(1) Ceratomia amyntor Hübner, Plate IV, Fig 6, ♀. (The Four-horned Sphinx.)

Syn. quadricornis Harris; ulmi Henry Edwards.

This common hawkmoth, which may be easily recognized by our figure, lives in the larval state upon the elm. It ranges from Canada to the Carolinas and westward through the Mississippi Valley, wherever its food-plant is found.
Sphingidae

(2) Ceratomia undulosa Walker, Plate VI, Fig. 7, ♀. (The Waved Sphinx.)
Syn. repentinus Clemens; brontes Boisduval (non Drury).
This hawkmoth, which may easily be separated from its congener by its lighter color and the distinct wavy maculation of the fore wings, lives in the larval stage upon the ash and the privet. It ranges from Maine and Canada to the Carolinas and westward into the trans-Mississippi region east of the great plains.

(3) Ceratomia catalpae Boisduval, Plate IV, Fig. 7, ♀. (The Catalpa Sphinx.)
The larva feeds upon various species of catalpa, and has in recent years been charged with doing considerable damage to these trees by denuding them of their foliage. The insect ranges from New Jersey and southern Pennsylvania southward to Florida and westward through the Mississippi Valley, wherever its food-plant occurs.

Genus ISOPARCE Rothschild & Jordan

(1) Isoparce cupressi Boisduval. (The Cypress Sphinx.)
The insect is of an almost uniform brown color on the upper surface of the wings, and may be distinguished from other species by the two conspicuous parallel dark markings on the limbal area of the fore wings. It is extremely rare in collections, only three or four specimens being as yet known. It has been reported from Georgia and Florida.

Genus DICYTOSOMA Rothschild & Jordan

This genus has been erected by Messrs. Rothschild & Jordan for the reception of the single species originally described by Strecker as Sphinx elsa.

Fig. 23.—Isoparce cupressi Boisduval.
EXPLANATION OF PLATE III

(When not otherwise indicated the specimens figured are contained in the collection of W. J. Holland.)

1. Pholus vittis Linnaeus, ♂.
2. Pholus fasciatus Sulzer, ♂.
3. Darapsa pholus Cramer, ♂.
5. Pholus achemon Drury, ♂.
6. Pholus pandorus Hübner, ♂.
7. Lapara bombycoides Walker, ♂.
8. Hemeroplanes parce Fabricius, ♂.
10. Dysodia oculatana Clemens, ♂.
11. Pholus labruscae Linnaeus, ♂.
13. Darapsa versicolor Harris, ♂.
15. Hemorrhagia gracilis Grote & Robinson, ♂.
16. Lapara coniferarum, Abbot & Smith, ♀, U.S.N.M.
Sphingidae

(1) Dictyosoma elsa Strecker, Plate V, Fig. 14, δ. (The Elsa Sphinx.)

This peculiarly colored hawkmoth, which may easily be recognized by the figure in our plate, occurs in Arizona. A number of years ago Mr. Jacob Doll reared a large number of specimens from the larvae. Since then but few specimens have been obtained, and it is as yet comparatively rare in collections.

Genus ATREIDES Holland

The generic name Atreus proposed by Grote and adopted on structural grounds by Rothschild & Jordan for this genus, having been preoccupied by Koch in the Arachnida, I have given the name Atreides to the genus, which contains the single species named originally Sphinx plebeja by Fabricius.

(1) Atreides plebeja Fabricius, Plate V, Fig. 6, δ. (The Plebeian Sphinx.)

This common species feeds in its larval state upon the trumpet-vine (Tecoma). It ranges from Canada to the Gulf States and westward to the Mississippi, wherever its food-plant is found. It is double-brooded in the Middle States, one brood appearing in June, the second in August.

Genus HYLOICUS Hübner

This genus, which includes some thirty species, most of which are found in America, though a few occur in Europe and Asia, is represented in our faunal limits by sixteen species, of which eleven are figured in our plates. It corresponds largely with the genus Sphinx as defined by many recent writers.

(1) Hyloicus eremitus Hübner, Plate VI, Fig. 6, φ. (The Hermit Sphinx.)

Syn., sordida Harris.

This hawkmoth, which is double-brooded, lives in the larval stage on spearmint (Mentha) and wild bergamot (Monarda). It ranges from New England southward to Georgia, and westward into the Mississippi Valley. It is not uncommon in western Pennsylvania, where it is double-brooded.

(2) Hyloicus eremitoides Strecker. (The Hermit-like Sphinx.)

Syn., lugens Grote (non Walker).
This species, which is allied to the preceding, may be easily recognized by its pale, silvery-gray color, by the almost entire absence of a dorsal stripe on the abdomen, and by the marking of the secondaries, which are grayish-white, having on the outer margin a broad band which is black inwardly, fading into darkish gray near the margin, a median irregularly curved black band, and at the insertion of the wing a black basal patch. The cut (Fig. 24) will enable the student to recognize the species, which is not common in collections. The insect is found in Kansas and the southwestern States.

(3) **Hyloicus separatus** Neumoegen, Plate VI, Fig. 10, ♂. (Neumoegen’s Sphinx.)

Syn. *andromeda* Boisduval (*partim.*); *lugens* Smith (*partim.*).

This species has been confused with others, but may easily be recognized from the figure which we give in our plate. It ranges from Colorado southward through New Mexico and Arizona into Mexico.

(4) **Hyloicus chersis** Hübner, Plate I, Fig. 1, larva; Plate VII, Fig 8, ♀. (The Chersis Sphinx.)

This common and widely distributed species ranges from Canada to Florida, westward to the Pacific, and southward into Mexico. Several local races are recognized, that which occurs upon the Pacific coast having been named *oreodaphne* by Henry Edwards. The caterpillar feeds upon the wild-cherry, the ash, the privet, and other allied plants. The insect is double-brooded in the Middle States, appearing on the wing in the latter part of May, and again in August.

(5) **Hyloicus vancouverensis** Edwards.

Syn. *vashti* Strecker.

Form *albescens* Tepper, Plate VI, Fig. 5, ♂. (The Vancouver Sphinx.)

There are two forms of this hawkmoth, one, *Hyloicus van-
Sphingidae

couverensis vancouverensis in which the middle of the thorax is pale gray, and the other, Hyloicus vancouverensis albescens, which has a very dark thorax, and which is figured on our plate. The moth is found from northern California to British Columbia, and eastward to Montana and Alberta.

(6) Hyloicus insolita Lintner, Plate V, Fig. 4, ♂. (Lintner's Sphinx.)

This species, which is well represented on our plate, occurs in Texas. It is not common in collections. Rothschild & Jordan regard it as a form of H. libocedrus Henry Edwards, and apparently with reason.

(7) Hyloicus perelegans Henry Edwards. (The Elegant Sphinx.)

This hawkmoth may be distinguished by the even dark silvery-gray color of the fore wings, which are crossed by a distinct submarginal whitish band. The maculation recalls a dark chersis with the dark thorax and the body of H. drupiferarum. It is found on the Pacific coast.

(8) Hyloicus canadensis Boisduval.

Syn. plota Streecker.

This species, which is not common, is represented by the accompanying cut (Fig. 25), drawn from a specimen in the Engel Collection in the Carnegie Museum, and taken in Massachusetts. It occurs in eastern Canada, northern New York, and New England.

(9) Hyloicus kalmbiae Abbot & Smith, Plate VI, Fig. 8, ♂. (The Laurel Sphinx.)

This hawkmoth feeds in the larval stage upon Kalmia, Chionanthus, and Fraxinus. It is not uncommon in the Middle States of the Atlantic coast region, ranging from southern Canada to Georgia.

(10) Hyloicus gordius Cramer, Plate V, Fig. 13, ♂. (The Gordian Sphinx.)

Syn. pacta Stephens.
Sphingidae

The larva of this hawkmoth feeds upon various rosaceous plants, as the wild rose and the crab-apple. It ranges over the Atlantic region from southern Canada and New England to Georgia, and westward to Colorado.

(11) *Hyloicus luscitiosa* Clemens, Plate V, Fig. 1, ♀. (Clemens' Hawkmoth.)

The caterpillar feeds upon various species of willow. The insect occurs from Canada to the Carolinas, and westward through the eastern portion of the valley of the Mississippi.

(12) *Hyloicus drupiferarum* Abbot & Smith, Plate VII, Fig. 7, ♂. (The Wild-Cherry Sphinx.)

This common and easily recognizable species ranges over the whole of temperate North America from the Atlantic to the Pacific. The caterpillar feeds upon various trees and shrubs, but seems in the Middle Atlantic States to prefer the wild-cherry as a food-plant.

(13) *Hyloicus dolli* Neumoegen.

Form *coloradus* Smith, Plate IV, Fig. 3, ♀. (The Colorado Sphinx.)

Rothschild & Jordan recognize two forms of this species, *H. dolli dolli* Neumoegen, and *H. dolli coloradus* Smith. The latter we figure. The former is prevalently lighter in color than the form *coloradus*. The insect ranges from Colorado to Arizona.

(14) *Hyloicus sequoiae* Boisduval, Plate V, Fig. 8, ♂. (The Sequoia Sphinx.)

The early stages of this insect we do not remember to have seen described. It occurs on the Pacific coast. Boisduval's type was found sitting on the trunk of a red-wood tree (*Sequoia*).

(15) *Hyloicus pinastri* Linnaeus. (The Pine Sphinx.)

Syn. *saniptri* Streeker.

The late Dr. Streeker reported this species as having been found by him in the vicinity of Reading, Pennsylvania, on one or two occasions. No one else has taken it, so far as is known. It is common in Europe, and has often been figured by European writers.

Besides the species above given, there are one or two other species of the genus found in our territory.
Genus LAPARA Walker.

Head small. Palpi short and slender. Tongue very short, almost obsolete. Eyes small. Antennæ slender. Thorax stout and short. Abdomen long and cylindrical, tapering. Legs weak. Fore and mid tibiae spinulose. The larva is without an anal horn, cylindrical, tapering slightly from the middle forward and backward, pale green, striped with white, and checkered with darker green. The caterpillars feed upon various species of pine, and are not at all sphingiform in appearance. There are reputed to be four species of the genus found in our fauna, two of which we figure. *L. halicarnæ* Strecker, of which only one specimen is known, which I have recently examined, appears to be a somewhat hypertrophied and, in consequence, aborted female of *L. coniferarum* Abbot & Smith. It is very doubtfully a valid species.

(1) *L. coniferarum* Abbot & Smith, Plate III, Fig. 16, ♀. (Abbot’s Pine Sphinx.)

Syn. *cana* Martyn.

This species is somewhat variable, especially in the size of the females and in the amount of marking upon the fore wings. It is a common insect in the foot-hills of the Alleghenies about the headwaters of the Potomac River. I found the larvæ in great abundance upon pines at Berkeley Springs, West Virginia, in the summer of 1884. It ranges from Canada to Florida and westward into the basin of the Mississippi, but has never been reported from any point west of that river, south of Minnesota, so far as is known to the writer.

(2) *L. bombycoides* Walker, Plate III, Fig. 7, ♂. (The Bombyx Sphinx.)

Syn. *harrisi* Clemens.

This little hawkmoth, which may easily be recognized from the figure we give, has the same geographical distribution as the preceding species, and feeds upon the same forms of vegetation in the larval stage.

*Lapara pineum* Lintner (Lintner’s Pine Sphinx) is a species of which thus far only two specimens have turned up. They differ from the two species we have figured in being wholly devoid of discal streaks and markings upon the fore wings. It is believed by recent authorities that these
Sphingidae specimens represent an extreme variation of the very variable *L. coniferarum*.

**SUBFAMILY AMBULICINÆ**

**Genus PROTAMBULYX** Rothschild & Jordan

This genus is represented in our fauna by a single species, which occurs as a straggler into the extreme southern limits of the United States, and is represented in Florida by a local race, to which Rothschild & Jordan have given the subspecific name of *carteri* in honor of Sir Gilbert T. Carter, the Governor of the Bahamas, an ardent lepidopterist. From *A. strigilis* Linnaeus, which is represented in the annexed cut, *A. carteri* may be distinguished by the fact that the fore wing is broader, less deeply excavated below the apex, and by the further fact that most of the lines and markings on the upper side of the wings and all the markings on the lower side of the wings are obsolete. While *strigilis* has not yet been reported from our territory, except as represented by the form above mentioned, it is highly probable that it will be found to occur in southern Florida.

**Genus SPHINX** Linnaeus

The type of the genus Sphinx of Linnaeus is unquestionably the well-known European species named by the immortal Swede *Sphinx ocellata*. With this species the following two species, which have for many years been referred to the genus *Smerinthus* Latreille, which sinks as a synonym, are strictly congeneric.

(1) **Sphinx cerisyi** Kirby, Plate VII, Fig. 3, ♂. (Cerisy's Sphinx.)

The larva feeds upon different species of willows. There are several forms, or subspecies, which have received names, and

---

*Fig. 26.—Protambulyx strigilis. (Somewhat reduced.)*
which run into each other to such an extent as to make it often impossible to distinguish them. These forms are *Sphinx astarte* Strecker, in which the outer margin of the fore wing is a little less dentate, and the brown markings of the same wing are a little narrower; *Sphinx ophthalmica* Boisduval, which has rather pale fore wings; *Sphinx pallidulus* Henry Edwards, in which the color of the fore wings is cinnamon-gray; and *Sphinx saliceti* Boisduval, in which the blue markings of the ocellus on the hind wing do not form a ring, but appear as two opposed crescents.

The insect is comparatively rare in the eastern part of the continent, but is not uncommon in the western States. It ranges from Canada in the north to the upper portions of the Gulf States, and westward to the Pacific, extending its habitat southward along the high lands of Mexico.

(2) *Sphinx jamaicensis* Drury.

Normal form *geminatus* Say, Plate IV, Fig. 11, δ. (The Twin-spot Sphinx.)

This beautiful hawkmoth was originally named and described in error by Drury as coming from the Island of Jamaica. He also was so unfortunate as to have had for his type an aberrant specimen in which the ocellus of the hind wing had but one blue spot. Such specimens now and then occur, and have been obtained by breeding from the normal form, to which Say gave the name *geminatus*. Specimens also sometimes occur in which there are three blue spots in the ocellus, and Mr. Grote gave to this aberrant form the name *tripartitus*.

The caterpillar feeds upon willows, birches, and various species of wild-cherry. The insect is quite common in the Middle Atlantic States, and ranges from southern Canada to the Carolinas and northern Georgia, and westward to eastern Kansas and Iowa.

Genus *CALASYMBOLUS* Grote

The genus differs from *Sphinx* in the fact that the head is crested, and the hind wing is on its costal margin toward the apex produced into a somewhat broad lobe. There are three species recognized as belonging to the genus, all of which we figure.
Sphingidae

(1) *Calasymbolus excæcatus* Abbot & Smith, Plate VII, Fig. 4, δ. (The Blinded Sphinx.)
**Syn. pavonina** Geyer.

The larva feeds upon various plants of the order *Rosaceæ*, but does not strictly confine itself to these. It has been reported as found upon the willow, the hazel, iron-wood, and other allied plants. It is a common species, and in the region of Pennsylvania is double-brooded. It ranges from southern Canada to Florida and westward across the valley of the Mississippi to the borders of the great plains.

(2) *Calasymbolus myops* Abbot & Smith, Plate IV, Fig. 12, ♂. (The Small-eyed Sphinx.)
**Syn. rosacearum** Boisduval.

The food-plants and the geographical distribution of this species are very much the same as those of the preceding species, though it seems to range a little further westward, examples having been received from Colorado. It is not nearly as common as *C. excæcatus*.

(3) *Calasymbolus astylus* Drury, Plate IV, Fig. 10, ♂. (The Huckleberry Sphinx.)
**Syn. io** Gray; **integerrima** Harris.

A rather scarce species, which is found from New England to Pennsylvania. The caterpillar feeds upon various species of *Vaccinium* and allied plants. The moth is easily distinguished by the fact that the outer margins of the fore wings are almost even, whereas in *myops* they are distinctly produced at the end of vein 3, and in *excæcatus* they are scalloped. The transverse lines on the limbal area of the fore wings, which are distinct in *myops*, are almost wanting in *astylus*, and the inner margin of the primaries is heavily margined with dark brown.

**Genus PACHYSPHINX** Rothschild & Jordan

The genus *Pachysphinx* has been erected for the reception of the single species, two forms of which we figure on our plates. It is very different from the oriental genus *Marumba*, into which Mr. Dyar, following Kirby, has put it in his recent List. Any one who is familiar with the peculiar style of coloration of the species of *Marumba*, as well as with the structural differences, which
Explanation of Plate IV

(The specimens figured are contained in the collection of W. J Holland.)

1. Protoparce quinquemaculatus Haworth, ♀.
2. Protoparce sexta Johanssen, ♀.
3. Hyloicus dolli coloratus Smith, ♀.
5. Hæmorrhagia senta Strecker, ♂.
7. Ceratomia catalpa Boisduval, ♀.
8. Isogramma hageni Grote, ♂.
9. Xylophanes pluto Fabricius, ♂.
present themselves, will recognize the propriety of the separation, which has been made.

(i) **Pachysphinx modesta** Harris, Plate VII, Fig. 1, ♀.
(The Big Poplar Sphinx.)

Form *occidentalis* Henry Edwards, Plate VII, Fig. 2, ♀.
(The Western Poplar Sphinx.)

Syn. *imperator* Strecker.

This noble hawkmoth feeds in the larval stage upon various species of the genus *Populus* and upon willows. There are a number of local races or subspecies, two of which we give; the common eastern form and the western variety. The latter may at once be distinguished by its generally paler coloration. It ranges over the United States and as far south as northern Mexico.

**Genus CRESSONIA** Grote & Robinson

There is but one species in this genus. The insect is easily recognizable, in spite of the fact that it varies considerably in the color of the wings.

(i) **Cressonia juglandis** Abbot & Smith, Plate VI, Fig. 9, ♀.
(The Walnut Sphinx.)

Syn. *instabilis* Martyn; *pallens* Strecker; *robinsoni* Butler.

The caterpillar feeds upon the black walnut, the butternut, and the hop-hornbeam. Some of the larvae are green, others are reddish, but the color of the larvae seems to have no relation to any variation in color of the perfect insects. The species is distributed from Canada to Florida and westward to the eastern boundary of the great plains.

**SUBFAMILY SESIINÆ**

**Genus PSEUDOSPHINX** Burmeister

There is but one species in this genus, which is structurally closely related to the species falling into the genus *Erinnyis*. It is a characteristic insect of the American tropics, and possesses a very wide range.

(i) **Pseudosphinx tetrio** Linnaeus, Plate VI, Fig. 2, ♀.
(The Giant Gray Sphinx.)

Syn. *plumeria* Fabricius; *rustica* Sepp; *hasdrubal* Cramer; *asdrubal* Poey; *obscura* Butler.
The larva of this hawkmoth has a long thread-like anal horn. It is very strikingly colored, the body being purplish black, girdled with yellow rings between the segments, and the head and anal claspers being bright red, of the color of sealing wax. It feeds upon various Euphorbiaceous plants, preferably Plumeria. The insect occurs not uncommonly in southern Florida.

**Genus ERINNYIS Hübner**

This is a moderately large genus, the species of which are all confined to the tropical or subtropical regions of the Western Hemisphere, though one species, as we shall see, occasionally occurs as a straggler far north of the metropolis of the genus.

(1) *Erinnyis alope* Drury, Plate V, Fig. 12, δ. (The Alope Sphinx.)

Syn. *flavicans* Goze; *fasciata* Swainson; *edwardsi* Butler.

The caterpillar is brown on the upper side, and pale green on the lower side, the colors being separated by a dark brown interrupted lateral band on either side of the body. On the third segment from the head there is a dark spot relieved by a red ring in the centre. The anal horn is quite short. The larva feeds upon *Jatropha* and *Carica*. The insect occurs in southern Florida and ranges southward as far as northern Argentina.

(2) *Erinnyis lassauxi* Boisduval.

Form *merianae* Grote, Plate V, Fig. 2, ♀. (Madame Merian's Sphinx.)

Syn. *janiphæ* Boisduval.

This hawkmoth, which is widely distributed through the tropics of the new world, displays considerable variation, and several forms, or local races, have been recognized. The one which occurs within our territory we have figured, and the student will have no difficulty in recognizing it. The larva, which is said to closely resemble that of the next species, is reported to feed upon *Morrenia* in the West Indies. It occurs in Florida.

(3) *Erinnyis ello* Linnaeus, Plate V, Fig. 10, δ; Fig. 3, ♀. (The Ello Sphinx.)

This is quite the commonest of all the hawkmoths of the American tropics, and becomes a perfect drug in collections made by amateur naturalists, who venture into those
regions, net in hand. It may at once be recognized by the figures we have given, which are taken from specimens bred on the Indian River by Mr. Wittfeld. The sexes are dissimilar, as the student may observe. It straggles north sparingly, even as far as Canada, and is common in the Gulf States.

(4) Erinnyis cœnotrus Stoll, Plate V, Fig. 11, ♀. (The Cœnotrus Sphinx.)

Syn. penœus Fabricius; melancholica Grote; piperis Grote & Robinson; picta Kirby.

The sexes in this species are dissimilar, the female being as represented on our plate with light fore wings, marked with dark spots and lines, while the male is prevalently quite dark on the fore wings. The species may easily be recognized by the black spots on the under side of the abdomen.

(5) Erinnyis crameri Schaus, Plate V, Fig 7, ♀. (Cramer's Sphinx.)

This species, which has often been confounded with the preceding, may easily be distinguished from it by the pale shoulder lappets, the absence of black spots on the under side of the abdomen, and the more evenly colored fore wings, which recall those of E. merianaæ, from which it is at once distinguished by the absence of the white lateral markings on the abdomen. The species occurs in Florida and Texas.

(6) Erinnyis obscura Fabricius, Plate V, Fig. 5, ♂. (The Obscure Sphinx.)

Syn. rustica Schaller; phalaris Kirby; stheno Hübner; pallida Grote; cinerosa Grote & Robinson; rheus Boisduval.

This small species is well represented in our plate by a specimen which in the main conforms to the most usual style of marking. It can always be distinguished from E. ello, which it resembles in having a dark longitudinal shade through the fore wings, by its much smaller size, and by the absence of the white and black lateral stripes upon the abdomen, which are characteristic of the latter species. It is common in Florida.

(7) Erinnyis domingonis Butler, Plate V, Fig. 9, ♀. (The Domingo Sphinx.)

Syn. obscura Walker (non Fabricius); festa Henry Edwards.

This species, which occurs in Florida and the Antilles, may be distinguished from the preceding by the darker color of the
Sphingidae

primaries and the absence of the pale color on the outer margin of the shoulder lappets, which is characteristic of *E. obscura*. It is also considerably larger than *E. obscura*.

There remains one other closely allied species in this group, to which Cramer gave the name caicus, and which occurs occasionally in Florida. The body is marked like *E. ello*, the fore wings are dark with longitudinal paler stripes, the secondaries are red as in *E. crameri*, but almost wholly without the dark border found in that species, it being replaced by a series of dark stripes running inwardly from the border toward the middle of the wing. For this species, hitherto associated with the preceding in the genus *Dilophonota*, Rothschild & Jordan have erected the genus *Grammodia*, upon structural grounds.

**Genus PACHYLIA** Walker

This is a small genus, containing four species, of which one occurs in our territory. It is not likely to be confounded with anything else.

(1) *Pachylia ficus* Linnæus, Plate III, Fig. 12, ♀. (The Fig Sphinx.)

Syn. *crameri* Méntriès; *lynea* Clemens; *venezuelensis* Schaufuss; *undatijascia* Butler; *aterrima* Bönninghausen.

This great hawkmoth, which is very common in Central and South America, occurs sparingly in Florida and Texas.

**Genus HEMEROPLANES** Hübner

This small genus, the species of which may at once be detected by the silvery spots of the fore wings, being the only American genus of sphingids thus adorned, is characteristically neotropical. It is represented in our fauna by a single species.

(1) *Hemeroplanes parce* Fabricius, Plate III, Fig. 8, ♂. (The Silver-spotted Sphinx.)

Syn. *licastus* Stoll; *galianna* Burmeister.

The figure given on our plate is sufficiently accurate to make a verbal description unnecessary. The insect occurs in southern Florida in the vicinity of Biscayne Bay, and ranges thence southward over the Antilles into South America.
Genus EPISTOR Boisduval

Five species belong to this genus, the type of which is the species which we figure, and the only representative of the genus found in our territory.

(1) *Epistor lugubris* Linnaeus, Plate II, Fig. 17, ♂. (The Mourning Sphinx.)

Syn. *fegeus* Cramer; *luctuosus* Boisduval.

There can be no difficulty in identifying this well-marked but obscurely colored hawkmoth, which occurs in Florida and Georgia, and even straggles now and then as far north as New Jersey. It is very common in the Antilles and South America. In Florida it is double-brooded, appearing on the wing in May and September. The larva feeds on the *Vitaceæ*.

Genus CAUTETHIA Grote

There are three species of this genus, only one of which occurs within the limits of the United States. The figure we give will permit of its identification without difficulty.

(1) *Cautethia grotei* Henry Edwards, Plate II, Fig. 21, ♂. (Grote's Sphinx.)

The habitat of this species is southern Florida, where it apparently is not uncommon.

Genus SESIA Fabricius

The body is depressed, fusiform, without lateral tufts, but with a broad fan-shaped anal tuft, composed of coarse flattened scales. The abdomen is produced for more than half its length beyond the hind wings. The palpi are produced and appressed, forming a short snout-like projection beyond the head. The tongue is stout, but comparatively short. The antennæ are slightly thickened at the end, and have a sharp recurved tip. The mid tibiae have terminal spurs, and the hind tibiae two pairs of spurs. The fore wings have eleven veins. The venation is characteristically sphingiform, and is illustrated in Figure 21. The prevalent colors are black and dark brown with white spots and bands on the wings and in some species on the abdomen. The moths fly in the hottest sunshine.

The type of the genus *Sesia* established by Fabricius is the species named *tantalus* by Linné. Rothschild & Jordan, in the
Sphingidae

latest Revision of the Sphingidae, recognize five species as belonging to the genus, three of which occur within the limits of the United States, *tantalus* Linnaeus, *fadus* Cramer, and the species we figure upon our plate. All three have by some recent writers been regarded as practically identical. Into the somewhat vexed question of their specific relationship it is not our purpose to enter in these pages.

(1) *S. titan* Cramer, Plate II, Fig. 16, ♂. (The White-banded Day-Sphinx.)

The white spots of the fore wings are semi-transparent. On the under side the wings are whitish at the base and on the inner margin of the secondaries. They are crossed about the middle by two parallel distinct dark bands, which are quite close to each other.

The moth sometimes strays as far north as Massachusetts. It is very common in southern Florida and throughout tropical America.

Genus HÆMORRHAGIA Grote

*Moth.*—Head small. Tongue as long as the body. Antennæ clavate, two-thirds the length of the costa, with a minute recurved hook at the tip. Thorax smooth, strongly projecting before the insertion of the wings. Abdomen more or less flattened beneath, and, especially in the males, adorned with a broad fan-shaped anal tuft. The primaries have eleven veins. Both primaries and secondaries are transparent about the middle; the outer margin of the former is evenly rounded, and of the latter slightly excavated between veins 1b and 2.

*Larva.*—Characteristically sphingiform, provided with an anal horn. The epidermis in most species of the genus is more or less granulated. The caterpillars feed for the most part upon *Symphoricarpus, Lonicera, Viburnum, Crataegus*, and allied plants.

*Pupa.*—The pupa, which is brown in color, is enclosed in a somewhat dense cocoon, formed on the surface of the ground under fallen leaves.

(1) *Hæmorrhagia thysbe* Fabricius, Plate I, Fig. 5, ♂. (The Humming-bird Clearwing.)

Syn. *pelasgus* Cramer; *ruficaudis* Kirby; *etolus* Boisduval.

62
Explanation of Plate V

(The specimens figured are contained in the collection of W. J. Holland.)

1. *Hyloicus luscitiosa* Clemens, ♂.
5. *Errinyis obscura* Fabricius, ♂.
Form *cimbiciformis* Stephens, Plate II, Fig. 6, ♀.

Syn. *ruficaudis* Walker (partim); *floridensis* Grote; *uniformis* Grote & Robinson; *buffalensis* Grote; *pyramis* Boisduval.

This is the largest and the commonest species of the genus. It may easily be recognized by the figures given on Plate II. It is subject to considerable variation. The form *cimbiciformis* is distinguished by the absence of the dentations on the inner side of the marginal brown band of the fore wings. It has been obtained by breeding from the eggs of *H. thysbe*, and *thysbe* has been bred from it. It is a dimorphic form of the species. The caterpillar of *H. thysbe* feeds upon *Viburnum* and allied plants. The insect ranges from Canada and Nova Scotia southward to Florida and westward to the Mississippi.

(2) *Hæmorrhagia gracilis* Grote & Robinson, Plate III, Fig. 15, ♂. (The Graceful Clearwing.)

Syn. *ruficaudis* Walker (non Kirby) (partim).

The thorax and basal segments above are olive-green. The middle segments are black, the two preterminal segments are margined laterally with reddish. The anal tuft is black, divided in the middle by red hairs. On the under side the palpi, pectus, and thorax are white, and the abdomen pale red. The pale area of the thorax is traversed on either side by a stripe of reddish hair, and there are three rows of white spots on the under side of the abdomen. It occurs in the States of the Atlantic seaboard from New England to the Carolinas.

(3) *Hæmorrhagia diffinis* Boisduval. (The Snowberry Clearwing.)

Spring form *tenuis* Grote, Plate II, Fig. 2, ♀.

Syn. *jumosa* Strecker; *metathetis* Butler; *diffinis* Beutenmüller.

Summer form *diffinis* Boisduval.

Syn. *marginalis* Grote.

Summer form *axillaris* Grote & Robinson, Plate II, Fig. 3, ♂; Fig. 4, ♀.

Syn. *grotei* Butler; *athira* Strecker.

This species is trimorphic. The life history has been in part very carefully worked out by Mr. Ellison Smythe of Blacksburg, Virginia. (See "Entomological News," Vol. XI, p. 584.) The form *diffinis* has the marginal band dentate inwardly.

The caterpillar feeds upon *Symphoricarpus*, *Lonicera*, and *Diervilla*. The insect has a wide range from New England to
George, and westward to the eastern boundaries of the great plains.

(6) Eumormothagia serica Krueger, Plate IV, Fig. 5, 6.
(The Californian Clearwing.)

The head, thorax, and basal segments of the abdomen are brownish-dimorphous. The abdomen is black. The two segments immediately preceding the terminal segment are marked laterally by yellow tufts of hair. The anal tuft is wholly black. The wings are very narrowly bordered with brown. There is no rusty red spot at the apex of the pterostigma. The clear portions of the wing in certain lights have a bright greenish-blue luster. The under side of the gland, the pterostigma, and the abdomen are pale straw-yellow. In size this species is about as large as A. oligum.

The perfect insect occurs in Utah and California, frequenting the bushes as well as lagoons.

(6) Eumormothagia thomis Beinnwald, Plate II, Fig. 1, 2.
(The Thins Clearwing.)

Decidedly smaller than either of the two preceding species. The thorax is olive-green, passing on either side into pale yellow. The color is continued dorsally on the abdomen as far as the terminal segment, but is more or less lost in the broad yellow præmental band. The basal and middle segments of the abdomen are marked internally with black, and the anal tuft is correspondingly marked with black on either side. The marginal band of the fore wing is narrow, as in A. oligum, and is always distinctly marked above and below at the apex by a carmine triangular spot. The wing in its insertion is more or less shaded with pale rusty red both above and below.

This species ranges from Colorado and Wyoming westward and northward to Oregon and British Columbia. It has been by Mr. Loure made synonymous with the following species, from which it is, however, quite distinct.

(6) Eumormothagia brucea F. French, Plate II, Fig. 1, 2.
(Bruce's Clearwing.)

This is a small species, of size approximating A. thomis, from which it may be at once distinguished by the green color of the
scales upon the thorax and the basal segments of the abdomen, and the fact that the small nut is wholly black, are divided by yellow scales on the middle as in the case in R. philolaus.

The species is not uncommon in Colorado and Utah.

SUBFAMILY PHILOMELIINAE

Genus PROLUS Hübner

This is a large genus, including nineteen species, and a number of subspecies. It is confined to the Western Hemisphere. Six species occur within our territory: Pl. sylphoides King, which we have not figured, is occasionally found in Arizona. The larvae feed upon the J. hawker, and in the case of two of the species have done at times some damage to vineyards.

1. Proclus satellite Linnæus. The Satellite Sphinx.

From pandora Hübner, Plate III., Fig. 10. 10.

Syn. amygaphage Walker.

This insect which is widely distributed throughout the eastern United States, and ranges northward into southern Canada, is well-known to all growers of grapes. The caterpillar, when it first emerges from the egg and for several successive molts is green in color and
Sphingidae

has at the anal extremity a very long caudal horn, which begins gradually to curl up, as represented in the accompanying cut, and after the third molt entirely disappears, being replaced by a lenticular shining eye-like prominence. In the latter stages of development the larva frequently become dark brown, and Professor Riley maintains that this is invariably the case in the neighborhood of the city of St. Louis. It is not invariably the case in other localities, as I know from experience. I have reared a number of specimens in which the green color perdured to the time of pupation, though the brown form is very common. Like the larva of the following species, the caterpillar of _P. satellitia_ has the power of withdrawing the first two segments of its body into the third, when at rest, or when suddenly alarmed. When crawling or feeding the first segments are protruded, as represented in the cut by the larger figure.

Several local races of _P. satellitia_ are recognized as occurring in the Antilles and in South America, one of these, for which Mr. Grote proposed the name _posticatus_, occurs in Florida, as well as in Cuba and the Bahamas. It may be distinguished from the form _pandorus_ by its slighter build, its narrower wings, which in the case of the primaries have the outer margin straighter than in _pandorus_, and by the presence of a large roseate spot covering the anal angle of the secondaries. There are other differences of a minor character, but those mentioned will enable the student to discriminate this form from the one we have figured.

(2) _Pholus achemon_ Drury, Plate III, Fig. 5, ♂. (The Achemon Sphinx.)

Syn. _crantor_ Cramer.

Like the preceding species the caterpillar of this beautiful hawkmoth feeds upon vines, and shows especial fondness for

Fig. 28.—Larva of _Pholus achemon_. (After Riley.)

the grape. It is also addicted to the Virginia creeper (_Ampe-lopis_). The description of the habits of the larva given by
Professor C. V. Riley, "Missouri Reports," Vol. III, p. 75, is most excellent. The figure which we give is taken from that Report.

The insect ranges over the entire United States from the Atlantic to the Pacific, and from southern Canada to northern Mexico.

(3) Pholus vitis Linnaeus, Plate III, Fig. 1, §. (The Vine Sphinx.)

Syn. hornbeckiana Harris; linnei Grote & Robinson; fasciatus Grote (partim).

The true Pholus vitis, which we figure in our plate, may easily be distinguished from its near ally, Pholus fasciatus Sulzer, by the absence of the pink outer marginal area on the upper two-thirds of the secondaries, by the inward prolongation of the large black spot near the inner margin of the secondaries into a well marked mesial band, and by its larger size. It occurs in Florida and in southern Texas and Arizona, whence it ranges southward over wide areas.

(4) Pholus fasciatus Sulzer, Plate III, Fig. 2, §. (The Lesser Vine Sphinx.)

Syn. vitis Drury (non Linnaeus); jussteia Hübner; strigilis Vogel.

The caterpillar is reported as feeding upon Jussieua in the tropics. In our territory it feeds upon various species of Vitaceae. It is quite common in the region of the Gulf States and southward, and sometimes is even taken as a straggler as far north as Massachusetts.

(5) Pholus labruscae Linnaeus, Plate III, Fig. 11, §. (The Gaudy Sphinx.)

Syn. clotho Fabricius.

This beautiful creature is characteristic of the tropics, where it is not uncommon. It occurs quite abundantly in southern Florida and along the borders of the Gulf, and throughout the Antilles, Central, and South America. Specimens, in spite of the subtropical habitat of the species, have been taken in Canada, illustrating the wonderful power of flight which is possessed by these insects, the frail wings of which bear them in the dusk of evening, during the few days of their existence in the winged form, from the orange-groves of the south to the banks of the St. Lawrence, a thousand leagues, across rivers, plains, and mountains.
Genus DARAPSA Walker

We include in this genus three species, all of which occur within our territory, and all of which we figure upon our plates.

(1) Darapsa pholus Cramer, Plate III, Fig. 3, $\delta$. (The Azalea Sphinx.)

Syn. choerilus Cramer; azalea Abbot & Smith; clorinda Martyn.

This medium-sized hawkmoth, which is one of our commonest species in western Pennsylvania, may easily be distinguished from its very near ally, D. myron, by its reddish color. The caterpillar feeds upon Viburnum and Azalea.

(2) Darapsa myron Cramer, Plate III, Fig. 4, $\delta$. (The Hog Sphinx.)

Syn. pampinatrix Abbot & Smith; cnotus Hübner.

The caterpillar, of which we give a figure, feeds upon wild and domestic grape-vines, and also upon the Virginia Creeper. It is a very common insect in the Atlantic States, and ranges as far west as Kansas and Iowa. It has been regarded as injurious to vineyards, but the damage done is inconsiderable, and the insects can easily be combated by picking off the larvae from the vines and crushing them under foot. The reason why these insects do comparatively small damage is perhaps found in the fact that they appear to be especially subject to the attacks of a small hymenopterous parasite, belonging to the family Ichneumonidae. The female ichneumon-fly deposits her eggs upon the epidermis of the young caterpillar. As soon as the eggs hatch, the grub penetrates the body of the caterpillar and feeds upon the fatty tissues lying just under the skin.
Before the caterpillar reaches maturity the grubs emerge from beneath the skin, and attaching themselves to the epidermis, proceed to weave about themselves little white cocoons, in which they are transformed into perfect insects, emerging to repeat the cycle of life. Caterpillars which have been thus parasitized do not survive the ordeal. The accompanying cut (Fig. 30), shows a larva upon which the ichneumon-flies have done their deadly work. The insect, which accomplishes the task of destruction imposed upon it in the economy of nature, is very small. The figure given herewith shows it of its natural size, and also enlarged, so that its structural peculiarities may be more easily recognized. The species which we are considering shares this liability to parasitism with its congener, as well as with the representatives of many other genera of the Sphingidae. I was greatly annoyed a number of years ago by having a large series of the larvae of the beautiful Darapsa versicolor, which I had collected in their early stages, destroyed by this ichneumon-fly, and the following summer, and, in fact, for several summers following, the larvae of D. versicolor, which had been for awhile quite abundant in certain localities known to me, almost entirely disappeared. In one ravine, where I had obtained them by the hundreds, they were not to be found. I account for their disappearance by the unusual numbers of the parasites which had infested them that summer.

The larva of myron undergoes pupation in a loose cocoon of coarsely woven threads of silk, which it spins under leaves at the surface of the ground. In this respect its habits are strictly like those of the other species of the genus.

(3) Darapsa versicolor Harris, Plate III, Fig. 13, 8. (The Hydrangea Sphinx.)
Sphingidae

This lovely hawkmoth, which is accounted quite rare in localities, has been found very commonly at certain times in western Pennsylvania. Its larva feeds upon the wild hydrangea, which grows abundantly in deep wooded glens, along the margin of brooks. The insect ranges from New England to the mountains of the Carolinas and westward into the eastern border of the Mississippi Valley.

Genus SPHECODINA Blanchard

The head is broad. The proboscis is nearly as long as the body. The antennæ are fusiform, with a recurved hook at the tip. The body is broad, flattened beneath. The abdomen has a pointed anal tuft, and the segments are adorned laterally with prominent truncated tufts of coarse hairs. The wings in their outline closely resemble those of the genus Amphion. Only one species of the genus is known.

(1) Sphecodina abbotti Swainson, Plate II, Fig. 19, 8. (Abbot's Sphinx.)

This beautiful hawkmoth is found throughout the Eastern States and southern Canada and ranges westward as far as Iowa and Kansas. The larva feeds on the Vitaceæ and is not uncommon on Ampelopsis. The caterpillar is not provided with an anal horn, but has instead an eye-like tubercle, or boss, at the anal extremity. It has the habit, when disturbed, of throwing its head violently from side to side, a movement found in other sphingid larvæ, and also in some of the Ceratocampidæ.
Explanation of Plate VI

(The specimens figured are contained in the collection of W. J. Holland.)

1. Cocytius antaeus Drury, ♀.
2. Pseudosphinx tetrio Linnaeus, ♂.
3. Herse cingulata Fabricius, ♂.
4. Dolba hylæus Drury, ♀.
5. Hyloicus vancouverensis albescens Tepper, ♂.
6. Hyloicus eremitus Hubner, ♀.
7. Ceratomia undulosa Walker, ♀.
8. Hyloicus kalmic Abbot & Smith, ♀.
Genus **DEİDAMIA** Clemens

The head is small, narrow, retracted, crested. The eyes are small. The antennæ are fusiform, with the tip bent back slightly, scarcely hooked. The thorax is stout, somewhat crested. The abdomen is conic, and in the male has a small anal tuft. The fore wings, which have twelve veins, are narrow, with the inner margin sinuate. The apex of the fore wings is truncated, and the outer margin is deeply excavated opposite the end of the cell and also just above the inner angle, which is distinctly produced. The hind wings are slightly crenulate on the outer margin. There is only one species belonging to the genus.

(1) **Deidamia inscriptor** Harris, Plate II, Fig. 15, ♂.  
(The Lettered Sphinx.)

The caterpillar feeds upon the wild grape-vine. The moth appears in the early spring. It is a common species in western Pennsylvania, but seems elsewhere to be regarded as quite rare. It ranges from Canada to Virginia and westward to the Mississippi.

Genus **ARCTONOTUS** Boisduval

This small genus, in which there are reputed to be two species, is very closely related to the genus *Proserpinus*, from which, as has been pointed out by Rothschild & Jordan, it differs in appearance "owing to the more woolly scaling." The chief structural difference is found in the fact that the antenna is not clubbed but fusiform, gradually curved, and the feet are without a pulvillus, and have only vestiges of the paronychium.

(1) **Arctonotus lucidus** Boisduval, Plate III, Fig. 14, ♂.  
(The Bear Sphinx.)

This insect, which hitherto has been rare in collections, appears to have a wide range along the Pacific coast, from southern California to British Columbia. It appears upon the wing very early in the spring of the year. The name *Arctonotus terlooi* is applied to a species, reported from northern Mexico by Henry Edwards, and described by him, in which the hind wings are wholly vinous red, and the green basal band of the fore wings is wanting.

71
Genus AMPHION Hübner

Head small. Eyes small, hemispherical. Palpi rather short. Tongue nearly as long as the body. Antennae fusiform with a long curved hook at the tip. Body plump, somewhat globose, the thorax projecting very little beyond the insertion of the primaries, and the abdomen terminating in a conspicuous fan-like tuft. The fore wings are comparatively short and narrow, excavated on the outer margin below the apex and above the inner angle, which is strongly produced. The inner margin is deeply sinuate. The hind wings are bluntly lobed at the anal angle. There is only one species in the genus.

(1) Amphion nessus Cramer, Plate II, Fig. 18, ♂. (The Nessus Sphinx.)

This species, which may easily be recognized from the figure on the plate, is not uncommon in the Middle States. It ranges from Canada to Georgia and westward to Wyoming. It flies in the daytime on cloudy days and in the late afternoon before sunset. The caterpillar feeds on Ampelopsis and the wild grape.

Genus POGOCOLON Boisduval

This small genus, which is closely related in many structural respects to Proserpinus, differs from it very decidedly in the form as well as in the habits of the insects belonging to it. In the structure of the antennae and neuration of the wings the insects belonging to Pogocolon show a close relationship to the insects referred to the genus Proserpinus, but the form of the abdomen is wholly different, elongated, cylindrical, and not bombyliform. The moths, moreover, are crepuscular, whereas the moths referred to the genus Proserpinus are diurnal in their habits, in this respect resembling the species of the genus Hæmorrhagia. There are at least three species belonging to this genus.

(1) Pogocolon gauræ Abbot & Smith, Plate II, Fig. 11, ♂. (The Gaura Sphinx.)

The upper side of this small species is sufficiently delineated in the plate to require no verbal description. On the under side the wings are vinous brown, shading on the outer third into olive-green, and reproducing the maculation of the upper surface. The hind wings are deep olive at the base, passing into yellowish green outwardly.
The insect feeds in the larval stage upon various species of *Gaura*, and ranges from Georgia to Texas and as far north as southern Kansas.

(2) *Pogocolon juanita* Strecker, Plate II, Fig. 12, ♂. (Strecker's Day-sphinx.)

The moth in the general style of its maculation is very much like the preceding species, but is considerably larger, and the colors are decidedly brighter. The caterpillar is quite different in its markings from the larva of *L. gauræ*.

The habitat of this species is Texas, so far as is now known. One other species of *Pogocolon*, *P. vega* Dyar, occurs in our region. It is much darker in color than the two former species, which it otherwise somewhat closely resembles.

Genus PROSERPINUS Hübnner

Head small; proboscis moderate or long; antennæ clavate; body stout; abdomen with or without lateral tufts, but always with a more or less well developed anal tuft. Anterior tibiae stout, armed with spines outwardly and at tip. Fore wings elongate, generally somewhat curved outwardly about the middle, and with the inner angle more or less distinctly produced; more or less densely clothed with scales over their entire surface. The moths are diurnal in their habits, and mimic bumblebees in their appearance.

(1) *Proserpinus flavofasciata* Walker, Plate II, Fig. 8, ♀. (The Yellow-banded Day-sphinx.)

The head and thorax are pale yellow, the latter obscured with brownish hairs about the middle. The abdomen is black with the basal segment about the middle and the preterminal segment on either side pale yellow. The fore wings on the upper side are blackish, crossed by an oblique whitish band. The hind wings are deep black, crossed by a broad orange-yellow band. The fore wings on the under side are bright orange-yellow at the base.

This is always a rare insect in collections. It ranges, so far as is known, through British America, and southward and eastward to Maine and Massachusetts. It is found in very early summer hovering over flowers.

(2) *Proserpinus clarkiae* Boisduval, Plate II, Fig. 10, ♀. (Clark's Day-sphinx.)
Sphingidæ

Syn. victoria Grote.

The head, thorax and abdomen on the upper side are prevalently pale olive-green, the fifth and the three anal segments of the abdomen being darker green. The fore wings are pale green with an oblique brownish median band, and a triangular paler brownish spot at the apex. There is a small black discal dot at the end of the cell. The hind wings are deep orange-yellow, margined with black. On the under side the wings are olive-green, darker at the base. The hind wings have a waved whitish band about their middle on the under side. The legs are greenish-white.

This species is found from Oregon to northern California, and eastward to Utah and Montana.

Genus EUPROSERPINUS Grote & Robinson

This genus is discriminated by Rothschild & Jordan from Proserpinus by the fact that the antenna is more abruptly hooked and slenderer at its extremity than in Proserpinus, and by the absence of the pulvillus and paronychium, which are found in Proserpinus. Two species belong to the genus, both having white hind wings margined with darker color and the under side of the pectus and the wings also white.

(1) Euproserpinus phaëton Grote & Robinson, Plate II, Fig. 9, ♂. (The Phaëton Sphinx.)

Syn. errato Boisduval.

The head and thorax above are gray, the abdomen blackish. The preterminal segment has yellow lateral tufts. The anal tuft is black. The fore wings above are of the same color as the thorax. The hind wings are yellowish-white with a broad black marginal band. Expanse 32 mm.

The habitat of this species is southern California.

(2) Euproserpinus euterpe Edwards. (The Euterpe Sphinx.)

This species, which is only known to the writer through an examination of the type, is discriminated from the preceding by the absence of pale tufts on the side of the abdomen and the fact that the marginal band of the hind wing is bowed inwardly and not straight as in E. Phaëton.
SUBFAMILY CHÆROCAMPINÆ

Genus XYLOPHANES Hübner

This genus, which is American, is very large, containing fifty species and many subspecies. Of these species two only are found, so far as is now known, within our territory, though it is possible that a thorough exploration of southern Florida may show that one or two of the species which are found in the Antilles also occur in that State. The student will have no difficulty in recognizing the species occurring within our borders by means of the figures which are given upon our plates.

(i) **Xylophanes pluto** Fabricius, Plate IV, Fig. 9, ♂. (The Pluto Sphinx.)
   Syn. *bœrhavia* Fabricius; *cræsus* Dalman; *thorates* Hübner; *eson* Walker

This beautiful hawkmoth, which is very common in the Antilles, ranging southward to southern Brazil, occurs in southern Florida. The larva feeds upon *Erythroxylon*.

(ii) **Xylophanes tersa** Linnaeus, Plate II, Fig. 13, ♂. (The Tersa Sphinx.)

This common and easily recognized species has a wide range, occurring very rarely as far north as southern Canada, thence southward to Texas and Mexico, and as far south as northern Argentina. The larva feeds on *Bonvardia, Spermacoce*, and *Manetta*.

Genus CELERIO Oken

Head of moderate size. Eyes hemispherical, not prominent. Antennæ distinctly clavate, and armed at the tip with a minute hook. The thorax is stout, projecting for about one-third of its length beyond the insertion of the fore wings. The abdomen is conic, unufted, produced more or less at the tip, and projecting for half its length beyond the hind margins of the secondaries. The fore wings, which have eleven veins, are produced at the apex. Their outer margin is slightly and evenly bowed outwardly. Their inner margin is very slightly sinuate. The hind wings have their outer margin evenly rounded, except at the extremity of vein 1\(b\), where they are slightly produced. The genus is well represented in the Old World, and there are several South American species. Only two species occur in our territory.
(1) *Celerio lineata* Fabricius, Plate II, Fig. 14, 8. (The Striped Morning Sphinx.)

Syn. *daucus* Cramer.

This is probably the commonest of all the North American Sphingidæ. The larva feeds upon *Portulaca*. There is considerable diversity in the maculation of the larvae. The two figures here given represent the two most usual forms of the caterpillar. The insect ranges over the southern portions of

![Light form of larva of *C. lineata*. (After Riley.)](image1)

British America to the Gulf of Mexico and southward to the Antilles and Central America. I have seen hundreds of the moths swarming about the electric lights in the streets of Denver, Cheyenne, and Colorado Springs. The moth flies con-

![Dark form of larva of *C. lineata*. (After Riley.)](image2)

stantly in bright sunshine on the Laramie Plains of Wyoming in the month of August, frequenting the blossoms of thistles. I have seen it busily engaged in extracting the sweets from dew-spangled beds of Soapwort (*Saponaria*), in the valleys of Virginia long after the sun had risen in the morning.

(2) *Celerio intermedia* Kirby, Plate II, Fig. 20, 2. (The Galium Sphinx.)

Syn. *epilobii* Harris (non Boisduval); *chamaenerii* Harris; *galli* Walker; *oxybaphi* Clemens; *canadensis* Guenée.

This hawkmoth, which is the North American representant of *Celerio gallii*, which is found all over the north temperate regions of the Eastern Hemisphere, ranges from Canada to

Vancouver and southward through the mountains of the Appalachian System and along the higher plateaus and mountain ranges of the West as far as Central Mexico. I have specimens taken in the Sierra Madre of Chihuahua. The identification of the species may easily be made by means of the figure on our plate.

THE WORLD OF THE DARK

"...... Sorrowing we beheld
The night come on; but soon did night display
More wonders than it veil'd; innumerable tribes
From the wood-cover swarm'd, and darkness made
Their beauties visible."

SOUTHEY.

There are two worlds; the world of sunshine, and the world of the dark. Most of us are more or less familiarly acquainted with the first; very few of us are well acquainted with the latter. Our eyes are well adapted to serve us in the daylight, but they do not serve us as well in the dark, and we therefore fail to know, unless we patiently study them, what wonders this world of the dark holds within itself. There are whole armies of living things, which, when we go to sleep, begin to awaken; and when we awaken, go to sleep. The eyes of the creatures of the dark are adapted to seeing with less light than our eyes require. The broad daylight dazzles and confounds them. Sunshine has much the same effect upon them that darkness has upon us. Our twilight is their morning; our midnight is their noonday.

This is true even of many of the higher vertebrates. The lemurs, which are a low family of simians, are nocturnal in their habits. So also is the Aye-Aye of Madagascar, and that curious little member of the monkey tribe known as the Specter (*Tarsius spectrum*). No one can see the great eyes of these creatures without realizing at a glance that they love what we call darkness better than what we call light, though they are far from being evil-doers. The great family of the cats are principally nocturnal in their habits. Their eyes are capable of being used in daylight, for the beautifully contracting and expanding iris modifies the amount of light admitted to the retina.
World of the Dark

far more delicately and instantaneously than any device, attached to the most perfectly constructed camera, regulates the amount of light transmitted through its lens. The tiger in the jungle sees what is going on about him in the starlight as well as we see what is happening in the noontide. I have studied the eyes of lions and tigers in the dark. The yellowish-green iris in the night almost entirely disappears from view, and shrinks down into a narrow ring. The windows of the eyes have the curtains drawn back wide, so as to let in all the light which the darkness holds within itself. The great orbs then look like globes of crystal, framed in a narrow band of gold, lying on a background of the blackest velvet, while in their pellucid depths, fires, tinged with the warm glow of blood, play and coruscate.

The eyes of many birds are adapted to the dark. This is true, as everybody knows, of the owls, and of their not distant relatives, the goat-suckers. I remember having, when a boy, dissected an owl, which I found dead after a long protracted period of intensely cold weather. The thermometer had stood at twenty degrees below zero for several nights in succession. The earth was wrapped deep in snow. Upon the sleety crust I found a great horned owl, lying dead, and frozen stiff. It may have died of old age, or it may have starved to death. The instinct of the child, who takes his toys to pieces in order to see how they are made, seized me, and, with a sharp penknife as a scalpel, and a few needles set in sticks of pine, I took my owl apart, and made drawings of what I found. I did not then know the names and functions of all the parts, but the drawing of the eye, which I made, I still have in an old portfolio, and there I saw it the other day. The eye of an owl is a wonderful piece of mechanism. It is a wide-angle lens of beautiful powers of adjustment. It is adapted to taking in all the light there is, when the light is almost all gone; and it is so contrived as to shut out light, when too much of its splendor would dazzle and hurt.

Among the insects thousands and tens of thousands of species are nocturnal. This is true of the great majority of the moths. When the hour of dusk approaches stand by a bed of evening primroses, and, as their great yellow blossoms suddenly open, watch the hawkmoths coming as swiftly as
meteors through the air, hovering for an instant over this blossom, probing into the sweet depths of another, and then dashing off again so quickly that the eye cannot follow them. My friend, Henry Pryer, had a great bed of evening primroses in his compound on the Bluff in Yokohama. Well I remember standing with him before the flowers, and, as the light began to fade upon the distant top of Fuji-no-yama, with net in hand capturing the hawkmoths, which came eagerly trooping to the spot. When it grew quite dark O-Chi-san held a Japanese lantern aloft to help us to see where to make our strokes. A dozen species became our spoil during those pleasant evenings. Ah! those nights in Japan! Can I ever forget them?

Did you ever reflect upon the fact that the wings of many moths, which lie concealed during the daytime, reveal their most glorious coloring only after dark, when they are upon the wing? Take as an illustration, the splendid moths of the great genus Catocala, the Afterwings, as we familiarly call them. The fore wings are so colored as to cause them, when they are quietly resting upon the trunks of trees in the daytime, to look like bits of moss, or discolored patches upon the bark. They furnish, in such positions, one of the most beautiful illustrations of protective mimicry which can be found in the whole realm of nature. The hind wings are completely concealed at such times. The hind wings are, however, most brilliantly colored. In some species they are banded with pink, in others with crimson; still others have markings of yellow, orange, or snowy white on a background of jet-black. One European species has bands of blue upon the wings. These colors are distinctive of the species to a greater or less extent. They are only displayed at night. The conclusion is irresistibly forced upon us that the eyes of these creatures are capable of discriminating these colors in the darkness. We cannot do it. No human eye in the blackness of the night can distinguish red from orange, or crimson from yellow. The human eye is the greatest of all anatomical marvels, and the most wonderful piece of animal mechanism in the world, but not all of power is lodged within it. There are other allied mechanisms which have the power of responding to certain forms of radiant energy to a degree which it does not possess.

Let me commend to the study of my readers this world of the
Saturniidae

dark of which I have been speaking. Some of the pleasantest excursions afield which can be made are those which the naturalist takes, when he has only moonlight or starlight to guide his steps. Always take a dark lantern with you. Without it you cannot see, and even with it you will not see much which it might be delightful to behold. But without a lantern you will not see a great deal, and you may in the thick wood get deeply mired in a boggy hole, or even break a limb. Your eyes are not made like those of the owl and the cat. Do not be afraid of the "night air." The air of the night has the same chemical composition as the air of the day. It is cooler, of course, and sometimes it has fog in it, but cool and even foggy air is not unhealthful. Scotchmen live half their lives in fog, but are healthy. The only things to be dreaded are the mosquitoes, carrying with them the germs of malaria, as we call it. These may be kept off if you only know how to anoint yourself with a properly prepared lotion.

FAMILY SATURNIIDÆ

"When, hypocritically clad in dressing-gown and slippers, I stopped at my guest's inner door and Fontenette opened it just enough to let me in, I saw, indeed, a wonderful sight. The entomologist had lighted up the room, and it was filled, filled! with gorgeous moths as large as my hand and all of a kind, dancing across one another's airy paths in a bewildering maze, or alighting and quivering on this thing and that. The mosquito-net, draping almost from ceiling to floor, was beflowered with them, majestically displaying in splendid alternation their upper and under colors, or, with wings lifted and vibrant, tipping to one side and another as they crept up the white mesh, like painted and gilded sails in a fairies' regatta."—G. W. Cable.

This family is composed of moths, which are for the most part medium-sized or large. The larvae are cocoon-makers. The perfect insects have vein 8 of the hind wings diverging from the cell from the base of the wings. The frenulum is wanting. The tongue is aborted, being at most extremely rudimentary. There are no tibial spurs on the legs. The antennæ are either singly or doubly bipectinated to the tips in the case of the males, and often in the case of the females. Bipectination of the antennæ occurs also in the family Geratocampidae, but in the latter family it never extends to the tip of the organ. The family falls into three subfamilies: the Atticinae; the Saturniinae; and the Hemi-
EXPLANATION OF PLATE VIII

(The specimens figured are contained in the collection of W. J. Holland.)

2. *Samia rubra* Behr, ♂.
5. *Autoxera zephyria* Grote, ♀.
7. *Heteropacha rileyana* Harvey, ♀.
8. *Samia columbia* Smith, ♂.
10. *Anisota virginiensis* Drury, ♀.
11. *Anisota rubicunda* Fabricius, ♂.
12. *Hylesia alinda* Druce, ♂.
leucinae. These subfamilies may be discriminated by the help of the following Key:

Hind wings with one distinct internal vein.
    Discal cell of both wings open - - - Attacinae.
    Discal cell of both wings closed - - - Saturninae.
Hind wings with two distinct internal veins - Hemileucinae.

81
SUBFAMILY ATTACINÆ

Genus PHILOSAMIA Grote

This genus, which may be distinguished from all others in our fauna by the tufted abdomen of the perfect insect, is represented by a single species, which, originally imported from the eastern parts of Asia, has become thoroughly acclimatized on the Atlantic seaboard in the vicinity of the larger cities, from which, as centres, it has spread to some extent to the surrounding country.

(1) Philosamia cynthia Drury, Plate IX, Fig. 2, ♂. (The Ailanthus Silk-moth.)

Syn. aurotus Fabricius; insularis Vollenhoven; vesta Walker; canningi Walker; walkeri Felder; pryeri Butler.

The cut (Fig. 36) and the representation on our plate obviate all necessity for mere verbal description of the species. The insect which was originally introduced into Europe about the middle of the last century was first introduced into America in the year 1861. It was hoped that it would prove a valuable silk-bearing species, but although a good grade of coarse silk may be made from it by the process of carding, and strong and serviceable fabrics are manufactured from it in China, no method of successfully and economically reeling the cocoons has yet been invented. The caterpillar feeds upon the ailanthus, and these shade trees in some places have been known to be completely defoliated by the worms.

Genus ROTHSCILDIA Grote

This characteristically neotropical genus may always be recognized by the large more or less triangular translucent spots of the wings, and the general likeness to the species we figure upon our plate. The abdomen is without tufts. The antennæ of both sexes are doubly bipectinated. The fore wings are generally considerably produced at the apex. Two species occur within our faunal limits.

(1) Rothschildia orizaba Westwood, Plate X, Fig. 1, ♀. (The Orizaba Silk-moth.)

From Rothschildia jorulla Westwood, the other species found in our territory, this is easily separated by its generally lighter color and the much larger size of the translucent spots.
upon the wings. Both species occur in Arizona, where they are not, however, nearly as common as they are in Mexico.

**Genus SAMIA Hübner**

In this genus, composed of quite large moths, characterized, as are the moths of the two preceding and the next succeeding genera, by having the discal cells open, we find that the spots on the middle of the wings are opaque, not hyaline, as in the genus *Rothschildia*; and, furthermore, the fore wings are more rounded and less produced than in that genus.

(i) **Samia cecropia** Linnaeus, Plate VIII, Fig. 1, ♂; Plate I, Fig. 8, larva. (The Cecropia Moth.)

This splendid moth, which is very common, is one of a small number of our native silk-moths, which attract more or less popular attention, and the spring of the year in our museums is always regarded as a period in which a certain portion of the time of the entomological staff will be consumed in replying to the letters of persons who, having for once opened their eyes to the wonders of the insect world, have sent in old matchboxes through the mails specimens of this insect, generally adding the information that the species is probably "new to science" or "excessively rare," they having for the first time in their lives noticed the moth.

The larva feeds upon a great variety of deciduous trees and shrubs, though manifesting a predilection for the *Rosaceae*, willows, maples, and the lilac. The cocoon is a familiar object. The insect is found over the whole Atlantic seaboard, and ranges westward to the eastern margin of the great plains.
Saturniidae

(2) **Samia gloveri** Strecker, Plate XII, Fig. 4, ♂. (Glover's Silk-moth.)

This species, which may be distinguished from the preceding by the more obscure, purplish color of the outer band, which in *S. cecropia* is bright red, ranges over the region of the Rocky Mountains from Arizona in the south to Alberta and Assiniboia in the north. A small dwarfed form has been taken upon the high mountains of Colorado, to which Neumoegen gave the subspecific name reducta.

(3) **Samia columbia** Smith, Plate VIII, Fig. 8, ♂. (The Columbian Silk-moth.)

This species, which is well represented in our plate, may be discriminated from its allies by its smaller size, and by the absence of the reddish outer shading of the transverse white line which crosses the wings about their middle. It ranges from Maine to Wisconsin, never, so far as is known at present, ranging south of the forty-first parallel of north latitude. While closely allied to *S. gloveri*, it is much smaller, and the larva shows marked differences. The caterpillar feeds upon the larch.

(4) **Samia rubra** Behr, Plate VIII, Fig. 2, ♂. (The Ceanothus Silk-moth.)

Syn. *ceanothi* Behr; *euryalus* Boisduval; *californica* Grote.

The species which is easily separated from its congeners by its small size and prevalently redder cast of coloration, is found on the Pacific coast, ranging eastward to Utah and Wyoming. The larva feeds upon *Ceanothus thyrsiflorus*.

Genus **CALLOSAMIA** Packard

The structure of the moths of this genus is much like that of the preceding genus, but the species composing it may invariably be discriminated from others by the fact that the pectinations of the antennae of the females in the anterior pair on each joint are shorter than the posterior pair. The genus contains several species, two of which are common in portions of our territory, and the other is a straggler into our fauna from Mexico.

(1) **Callosamia promethea** Drury, Plate I, Fig. 2, larva; Plate XI, Fig. 11, ♂, Fig. 12, ♀. (The Spice-bush Silk-moth.)

Every country boy who lives in the Atlantic States is familiar with the cocoons, which in winter and spring he has found

3. *Agapema galbina* Clemens, ♀, U. S. N. M.
5. *Automeris io* Fabricius, ♀.
8. *Pseudohazis hera* Harris, ♂.
9. *Zeuzera pyrina* Linnaeus, ♀
Saturniidae

hanging from the twigs of the spice-bush, the sassafras, and other trees. As they dangle in the wind they are easily detected, though they are often wrapped in the dead leaf in which the caterpillar originally spun them. The larva of which, in addition to the figure given in Plate I, we furnish a cut herewith, is a rather striking object, the coral-red tubercles on the second and third anterior segments showing conspicuously against the bluish-green epidermis. The insect subsists in the larval stage upon a great variety of deciduous shrubs and trees, showing a

![Figure 38](image)

*Fig. 38.* _Callosamia promethea._
a, Young larva; b, front view of head; c, magnified view of a segment of young larva; d, mature larva. (After Riley.)

special predilection for the _Lauraceae_, _Liriodendron_, _Liquidambar_, and the wild-cherry. It ranges over the Atlantic States from Florida to New England into southern Canada, and thence westward through the valley of the Mississippi to the eastern boundaries of the great plains. Whether the silk produced by this common and easily reared species could be utilized in such a way as to make its production commercially profitable is a problem to be solved in the future. No one up to

![Figure 39](image)

*Fig. 39.* Cocoon of _C. promethea_. (After Riley.)
Saturniidae

the present time has succeeded either in reeling or carding the silk of the cocoons.

(2) Callosamia angulifera Walker, Plate VIII, Fig. 3, δ, Fig. 4, ♀. (The Tulip-tree Silk-moth.)

This species may easily be discriminated from the last named by the fact that the males are not without discal spots as in that species, but have large angular white spots, causing them to resemble in this respect the females of C. promethea. The larva feeds commonly on the tulip-poplar (Liriodendron). The cocoon is not suspended from the twigs, as in the case of C. promethea.

The only other species of the genus, which occurs in our fauna, is Callosamia calleta Westwood, which may be differentiated from the two foregoing species by the fact that it has a whitish band on the collar and at the base of the thorax.

SUBFAMILY SATURNINÆ

The discal cells are closed. The antennæ are pectinated in both sexes to the tip. The hind wings have but one internal vein distinctly developed. But four genera representing this sub-family are found within our territory.

Genus AGAPEMA Neumægen & Dyar

The antennæ of both sexes are doubly bipectinated, those of the female having both the anterior and posterior pectinations of equal length. Only one species is known.

(1) Agapema galbina Clemens, Plate IX, Fig. 3, δ. (The Galbina Moth.)

This interesting insect occurs in southern Texas, Arizona and Mexico. The larval stages have been described by Henry Edwards (see "Entomologica Americana," Vol. IV, p. 61). The specimen figured is considerably darker than the figures given by Strecker. Specimens as light as those he depicts have never fallen into the hands of the author.

Genus ACTIAS Leach

The species of this genus may easily be discriminated by their pale green color, and the tailed hind wings. The pectinations of the antennæ in the female sex are shorter in the anterior pair on
each joint than the posterior pair. The genus is quite large, but only one species occurs in temperate North America. It is better represented in the Old World.

(1) Actias luna Linnaeus, Plate XII, Fig. 7, δ. (The Luna Moth.)

This common and well-known insect has an extensive range from Canada to Florida and westward to Texas and the trans-Mississippi States as far as the region of the great plains. The larva, of which we give a representation, feeds upon the various species of walnut and hickory, the sweet-gum (Liquidambar), the persimmon (Diospyros), and other trees. In North Carolina it appeared to be particularly fond of the persimmon. The cocoon is thin and papery, spun among leaves, and falls to the ground in autumn. In consequence it is not nearly as often found as those of some other species, which have been described in the preceding pages.

Genus TELEA Hübner

This is a very small genus, including only two or three species. It is confined to the New World. The only representative in our faunal limits is the well-known species, which we figure.

(1) Telea polyphemus Cramer, Plate IX, Fig. 1, ♀. (The Polyphemus Moth.)

Syn. paphia Linnaeus; fenestra Perry; oculea Neumaeígen.

This very common moth feeds in the larval stage upon a great variety of trees and shrubs. I have found the caterpillar upon various species of oaks, upon the two species of Juglans, which grow in the Eastern States, upon hickory, basswood, elms, maples, birches, chestnuts, the sycamore (Platanus), wild-
Saturniidae

roses, and the beech. Other observers have reported the larva as found upon a great variety of other trees. The caterpillar,

Fig. 41.—Larva of Telea polyphemus. (After Riley.)

which is of a beautiful shade of green, is ornamented on the sides by raised lines of silvery white, and is altogether a beautiful object, so far as coloration is concerned. The cocoon is in form like that of Actias luna, but is much more dense, and, after it has been spun up, is injected by the larva with a fluid, which appears to precipitate a white chalky matter through the fibers after it has dried. Efforts to reel the silk have hitherto amounted to but little. The insect is double-brooded in the southern States. In Pennsylvania and northward it is single-brooded. The moth ranges across the entire continent and into Mexico in the South. We have given in Figure 5 a representation of the pupa, in Figure 10 a cut of the antenna greatly enlarged, and in Figures 41 and 42 are shown the larva and the cocoon. The latter, as is illustrated in the cut, is spun among leaves, and falls in the autumn to the ground. A number of aberrant forms and local races have been described, and there is considerable variety in the depth of the ground-color of the wings
EXPLANATION OF PLATE X

(Except when otherwise indicated the specimens figured are in the collection of W. J. Holland.)

1. Rothschildia orizaba Westwood, ♀.
2. Basilona imperialis Drury, ♀.
3. Citheronia regalis Fabricius, ♂
5. Adelocephala bicolor Harris, ♂.
6. Adelocephala bicolor Harris, ♀.
7. Syssphinx albolineata Grote & Robinson, ♂.
8. Coloradia pandora Blake, ♂.
9. Malacosoma disstria Hubner, ♂, U. S. N. M.
10. Malacosoma erosa Stretch, ♂.
12. Malacosoma americana Fabricius, ♀, U. S. N. M.
in a long series of specimens collected in the same locality. I have one or two fine melanic specimens, in which the wings are almost wholly black on the upper side. Albino specimens are also occasionally found.

Genus SATURNIA Schrank

This genus is represented in our fauna by a single species.

1. *Saturnia mendocino* Behrens, Plate XII, Fig. 6, ♂.
   (The Mendocino Silk-moth.)
   The insect inhabits northern California, where it is not uncommon. The larva feeds upon *Arctostaphylos tomentosa*.

Genus AUTOMERIS Hübner

Four species of this genus occur within our borders. Three of them we figure on our plates. The other, *Automeris zelleri* Grote & Robinson, may be distinguished from those we give by its much greater size, the female expanding fully five inches across the wings, and having three broad brown bands parallel to the margin of the hind wing, a large blind ocellus in the middle of that wing, and the fore wings purplish brown, marked with darker brown spots at the base, the end of the cell, and on the limbal area.

1. *Automeris pamina* Neumoegen, Plate IX, Fig. 6, ♂.
   (The Pamina Moth.)
   The figure we give is taken from an example of the form called *aurosea* by Neumoegen, in which the hairs along the inner margin of the hind wings are somewhat more broadly rosy red than in the specimens which he indicated as typical. The specimen was labeled by, and obtained from, the author of the species.

2. *Automeris zephyria* Grote, Plate VIII, Fig. 5, ♀.
   (The Zephyr Silk-moth.)
   This beautiful insect which is found in New Mexico, is well delineated in our plate, and may easily be discriminated from other species by the white transverse lines of the fore wings.

3. *Automeris io* Fabricius, Plate IX, Fig. 4, ♂, Fig. 5, ♀.
   (The Io Moth.)
   Syn. *corollaria* Perry; *varia*, Walker; *fabricii*, Boisduval; *argus* Neumoegen & Dyar.

89
Saturniidae

This common insect, which ranges from Canada to Florida, and westward and southward to Texas and Mexico, subsists in the larval stage upon a large variety of trees and shrubs; in fact, the caterpillar is almost omnivorous. The larva is a beautiful object, the body being green, ornamented with a lateral stripe of pink and creamy white and covered with clusters of branching spines. These are possessed of stinging properties, and the caterpillar should be handled with extreme care, if painful consequences are to be avoided. In spite of this defense the larvae are greatly liable to the attack of ichneumon wasps, which destroy multitudes of them.

Genus HYLESIA Hübner

This is a neotropical genus of small size, one species of which, common enough in Mexico, is occasionally found in Arizona. It is a true Saturnian, the secondaries having but one inner vein and the discal cells in both wings being closed.

(1) Hylesia alinda Druce, Plate VIII, Fig. 12, δ. (The Alinda Moth.)

The specimens I have were taken on the Mexican border of Arizona. So far as I remember, nothing has been written upon the life-history of the species.

SUBFAMILY HEMILEUCINÆ.

The moths of this subfamily may be structurally differentiated from their near allies by the fact that the hind wings have two distinct internal veins, 1a and 1b. The antennæ of the male insect in the genus Coloradia are doubly bipectinated. In the
genera Hemileuca and Pseudohasis, the antennæ of the males are singly bipectinated. In the former genus the females have bipectinated antennæ; in the latter the females have the antennæ serrate, or very feebly pectinated.

**Genus COLORADIA Blake**

(1) Coloradia pandora Blake, Plate X, Fig. 8, ♂. (The Pandora Moth.)

The range of this insect is from the eastern foot-hills of the Rocky Mountains to the Cascades, and from Montana to Mexico.

**Genus HEMILEUCA Walker**

Eight species of this genus are known from our territory, four of which we figure. *H. electra* Wright has the hind wings more or less red with a black border. *H. grotei* is a black species with a white collar, and a series of narrow white spots covering the middle of the wings, three on the fore wing, and those on the hind wing composing a narrow median band. *H. neumægeni* is a beautiful insect with snowy white thorax and reddish brown abdomen. The wings are snowy white with orange discal marks crossed by two black bands on the primaries and one on the secondaries, the inner line of the primaries being relieved externally by an orange spot bordered with black. *H. hualapai* Neumoegen has the wings dull pink, either without markings, or crossed by two pale lines. The form with the pale transverse lines has been dubbed *sororius* by Henry Edwards.

(1) Hemileuca maia Drury, Plate XI, Fig. 1, ♂. (The Buck-moth.)

Syn. *proserpina* Fabricius.

In the fall of the year, when the leaves are falling and the days are still mellow and warm, the Buck-moths may be seen flitting through the air at noonday. They especially frequent the edges of groves of oaks. Upon the twigs of these trees, as well as occasionally upon willows, wild cherry-trees, and hazels, they deposit their eggs in clusters, as represented in Figure 44. The larvæ, which are gregarious and have stinging spines or bristles upon the somites, hatch in the latter part of April or in May, according to latitude, and after undergoing five molts, pupate in
the ground. The moths emerge in the fall, though a few winter over in the soil until the next spring, when they emerge, or they may even remain dormant until the following fall.

The wings are semi-translucent, and in some specimens are apparently almost devoid of scales. The insects are diurnal, or semi-crepuscular in their habit, and I have never known them to be attracted to artificial light. The name "Buck-moths" is said to have been given to them because they fly at the time when deer-stalking is in order.

The insect ranges from Maine and Nova Scotia to Florida and westward to the eastern edge of the great plains. In the Carolinas it is very common, especially in groves of the Black-jack Oak, which grow on barren uplands.

(2) *Hemileuca nevadensis* Stretch, Plate XI, Fig 2, 3. (The Nevada Buck-moth.)

Syn. *californica* Wright; *arirnitis* Packard.

This species, which closely resembles the preceding, may be distinguished from it by the much wider expanse of the transverse discal bands in both wings, and the much redder tuft of anal hairs. It may be a mere local race of *Hemileuca maia*, but most authors have recently accorded it specific rank.

(3) *Hemileuca juno* Packard, Plate XII, Fig. 8, 3. (The Juno Moth.)

Syn. *pygopai* Neumegen.
Explanation of Plate XI

(The specimens figured are contained in the collection of W. J. Holland.)

1. Hemileuca maia Drury, ♂.
2. Hemileuca nevadensis Stretch, ♂.
5. Pseudohazis eglanterina muttalli Streeker, ♂.
7. Toptype velleda Stoll, ♂.
8. Toptype velleda Stoll, ♀.
9. Anisota stigma Fabricius, ♂.
10. Anisota stigma Fabricius, ♀.
14. Syssphinx heiligbrodii Harvey, ♀.
15. Cargida pyrrha Druce, ♂.
16. Fenaria longipes Druce, ♂.
17. Xanthopasitis timais Cramer, ♀.
18. Euchætias murina Stretch, ♀.
19. Copidryas cosyna Druce, ♂.
20. Apantesis intermedia Stretch, ♂.
This beautiful moth occurs in Arizona and northern Mexico.

(4) **Hemileuca tricolor** Packard, Plate XII, Fig. 9, ♂. (The Tricolor Buck-moth.)

This species, like the preceding, is found in Arizona and in New Mexico. The larvae feed upon the Grease-wood, according to report.

**Genus PSEUDOHAZIS** Grote & Robinson

This is a small genus of rather striking and exceedingly variable insects, the life histories of which have not been as thoroughly studied as is desirable. The moths appear to be diurnal in their habits, and may be found in vast numbers in the morning hours on bright days in their favorite haunts in the region of the Rocky Mountains. I have found them particularly abundant about Laramie Peak in Wyoming in the latter part of June and July. They appear to frequent flowers in company with diurnal lepidoptera, as the various species of *Argynnis*, and they may then be easily taken. Their flight is rapid. They are characteristic of the country of the sage-brush, and the ranges of the western sheep-herder.

(1) **Pseudohazis eglanterina** Boisduval.

Form *nuttalli* Strecker, Plate IX, Fig. 7, ♂; Plate XI, Fig. 5, ♂. (Nuttall's Sheep-moth.)

Syn. *shastaensis* Behr; *denudata* Neumüegen.

The two figures given on our plates show two forms of this well-known insect. Whatever the amount of black or purple upon the fore wings the specimens may always be distinguished from others by the presence just beyond the discal spot of the fore wings of a longitudinal dash of Indian yellow. This is characteristic, and I have never failed to find it in a long series of specimens, no matter how the other markings varied.

(2) **Pseudohazis hera** Harris, Plate IX, Fig. 8, ♂. (The Hera Moth.)

Form *pica* Walker, Plate XI, Fig. 3, ♂; Fig. 4, ♀. (The Magpie Moth.)

This extremely variable moth is represented by the typical form in the figure given upon Plate IX, and in the figures given upon Plate XI by two specimens showing the form, which is
Ceratocampidæ

most common in Colorado and Wyoming, in which the wings are greatly suffused with black. To this form Walker's name pica properly applies.

FAMILY CERATOCAMPIDÆ

"In Nature's infinite book of secrecy
A little I can read."—Shakespeare.

This family contains moths, of large or medium size, the larvae of which do not produce cocoons, but undergo transformation in the ground. The larvae are generally more or less ornamented with spines and bristly protuberances. The moths have the tongue developed, but nevertheless feebly. The tibial spurs are present. The frenulum is lacking. The genera belonging to this family are American, and only five of them occur within our faunal limits.

Genus ANISOTA Hübner

Of the five species, recognized as belonging to this genus and occurring within our borders, we have selected three for representation. Anisota senatoria, a common species found in the Atlantic States, is distinguished from its very near ally, Anisota virginiensis, not only by marked differences in the larval stage, but by the fact that the females are almost exactly like the female of Anisota stigma, profusely covered with black spots or frecklings on the wings, while the females of virginiensis, as shown in the plate, are almost wholly destitute of such spots. The males of these two species are almost alike, the only difference being that the male insect in the case of virginiensis is somewhat darker than in the case of Anisota senatoria, and less ochreous.

(1) Anisota stigma Fabricius, Plate XI, Fig. 9, ♂; Fig. 10, ♀. (The Stigma Moth.)

The caterpillar feeds upon various species of oak. It is ornamented with short spines upon the segments, arranged in rows, those on the second segment from the head being long and recurved. The color of the larvae at maturity is a dull reddish brown, marked with small creamy-white and gray punctulations. The insect occurs in the Appalachian faunal region, from Canada to the Carolinas, and westward to Kansas and Missouri.
(2) Anisota virginiensis Drury, Plate VIII, Fig. 9, ♂; Fig. 10, ♀. (The Virginian Anisota.)

Syn. astymone Olivier; pellucida Herrich-Schaeffer.

The male insect has the fore wings almost transparent about the middle, as is the case with Anisota senatoria, as has already been pointed out, but the female is not heavily spotted, as is the case in that species. The caterpillar feeds upon oaks. The moth has the same geographical distribution as the preceding species.

(3) Anisota rubicunda Fabricius, Plate VIII, Fig. 11, ♂.

(The Rosy Maple-moth.)

The larva of this beautiful moth feeds commonly upon the silver-maple, which in many of our western cities has been extensively planted as a shade-tree. The depredations it commits upon the foliage have subjected it to the indignation of arboriculturists. It was formerly very common in the city of Pittsburgh, but for many years past it has almost entirely disappeared, so that it is now regarded as a rather rare insect by local collectors. The disappearance of the moth is due no doubt to the combined influence of the electric lights, which annually destroy millions of insects, which are attracted to them, and to gas-wells, and furnaces, which lick up in their constantly burning flames other millions of insects. Perhaps the English sparrow has also had a part in the work of extermination. In Kansas the insect is very common. I recently saw in the city of Atchison numerous maples, which had almost been stripped of their leaves by these larvae. The range of the insect is practically the same as that of the other species of the genus.
Ceratocampidae

Genus ADELOCEPHALA Herrich-Schaeffer

As in the preceding genus, vein 11 of the fore wing is stalked with veins 6-8, but the outer margin of the wing is not straight as in that genus, and longer than the internal margin, but it is convex and shorter than the inner margin. There are a number of species belonging to the genus, which are indigenous in Central and South America, but only one occurs within our borders.

(1) Adelocephala bicolor Harris, Plate X, Fig. 5, ♂; Fig. 6, ♀. (The Honey-locust Moth.)
   Syn. distigma Walsh.
   The larva feeds upon the Honey-locust (Gleditschia) and the Kentucky Coffee-tree (Gymnocladus). It is a rather common insect in the valley of the Ohio, and ranges from the region of the Great Lakes southward to Georgia and Kansas.

Genus SYSSPHINX Hübner

The insects assigned to this genus by recent writers do not differ greatly in structure from those referred to the preceding genus. The principal structural differences consist in the fact that the antennae of the females are somewhat shorter and less strongly pectinated, and the abdomen is generally longer, in some species greatly exceeding the hind margin of the hind wings. The genus is well represented in Mexico and Central America. Only four species occur in our territory, two of which we figure.

(1) Syssphinx albolineata Grote & Robinson, Plate X, Fig. 7, ♂. (The White-lined Syssphinx.)
   Syn. raspa Boisduval.
   The figure we give is sufficient to enable the student to identify this species which is common in Mexico, and also occurs in southern Arizona.

(2) Syssphinx heiligbrodti Harvey, Plate XI, Fig. 14, ♀. (Heiligbrodt’s Syssphinx.)
   This very pretty moth, which may easily be determined by the help of the figure we give, is not uncommon in southern Arizona. The caterpillar feeds, it is said, upon Grease-wood bushes.
Genus CITHERONIA Hübner

This genus of large and showy moths is characteristically neotropical, having its metropolis in Central America. Three species occur in our territory, two of them having an extensive northern range.

(1) Citheronia regalis Fabricius, Plate I, Fig. 4, larva; Plate X, Fig. 3, ♂. (The Royal Walnut-moth.)
   Syn. regia Abbot & Smith.
   The caterpillar, which is known by boys as the "Hickory Horn-devil," feeds upon a great variety of trees and shrubs, showing a decided preference for the walnut and butternut, the persimmon, and several species of arborescent sumac (Rhus).

(2) Citheronia sepulchralis Grote & Robinson, Plate XLI, Fig. 5, ♀. (The Pine-devil Moth.)
   The larva, which is smaller and more obscurely colored than that of the preceding species, feeds upon various species of pine, and the insect ranges from the Carolinas northward to Massachusetts along the coast. It is not uncommon in the valley of the Potomac, and at Berkeley Springs I have found it abundant in the larval state in the months of July and August.

(3) Citheronia mexicana Grote & Robinson, Plate X, Fig. 4, ♂. (The Mexican Walnut-moth.)
   This species, which is in many respects very closely allied to C. regalis, occurs in Arizona, and southward.

Genus BASILONA Boisduval

The only representative of this genus within the limits of the United States is the species which is illustrated on our plates. There are a number of other species, which are Mexican or South American.

(1) Basilona imperialis Drury, Plate X, Fig. 2, ♀; Plate XI, Fig. 13, ♂. (The Imperial Moth.)
   Syn. imperatoria Abbot & Smith; punctatissima Neumoegen.
   The larva feeds upon a vast number of trees and shrubs, and may almost be described as omnivorous. The larvæ are either brown or green, the color having nothing whatever to do with the character of the perfect insects, which emerge from the pupæ. Such cases of dichromatism among larvæ are not at all uncommon.

97
Syntomidae

FAMILY SYNTOMIDÆ

"Whoever looks at the insect world, at flies, aphides, gnats, and innumerable parasites, and even at the infant mammals, must have remarked the extreme content they take in suction, which constitutes the main business of their life. If we go into a library or news-room, we see the same function on a higher plane, performed with like ardor, with equal impatience of interruption, indicating the sweetness of the act."—EMERSON.

This family, which quite recently has been monographed by Sir George F. Hampson, consists of moths which are small, or at most of medium size. They are diurnal in their habits, and frequent flowers. At first glance, they often are mistaken for wasps and other hymenoptera, which they mimic. The following characterization of the family is quoted from the learned author, to whom reference has just been made:

"Proboscis usually well developed, but sometimes aborted; palpi short and porrect, long and downcurved, or upturned; frons rounded; antennæ simple, ciliated, or bipectinate, usually with short branches dilated at extremity in both sexes; tibiae with the spurs short. Fore wing usually with the terminal area broad; vein 1a forming a fork with 1b, 1c absent; 5 from below middle of discocellulars; 7 stalked with 8, 9. Hind wing small; vein 1a often absent; 1c absent; 8 absent, rarely rudimentary and not reaching costa; frenulum present; retinaculum bar-shaped." Hampson, Catalogue of the Lepidoptera Phalæna, Vol. I, p. 20.

Eleven genera comprised within this family are recognized by recent writers as holding place in the fauna of the United States and Canada. Most of these are southern, and represent a northern movement of the great complex of genera and species referable to the family, which inhabits the hot lands of equatorial America.

Genus COSMOSOMA Hübner

This is a large genus, including at least eighty species, which are found in Central and South America. Only one species is, at present, known to occur within our faunal limits.

(1) Cosmosoma auge Linnaeus, Plate XIII, Fig. 1, 3. (The Scarlet-bodied Wasp-moth.)

Syn. omphale Hübner; melitta Möschler.
This beautiful little insect occurs throughout the tropics of the New World, and is not rare in southern Florida. The larval stages have been described by Dyar (see "Psyche," Vol. VII, p. 414). The caterpillar feeds upon Mikania scandens.

**Genus SYNTOMEIDA Harris**

The type of this genus is *Syntomeida ipomeæ*. Six species have thus far been assigned to it, two of these occurring in the extreme southern portions of our territory.

(1) **Syntomeida ipomeæ** Harris, Plate XIII, Fig. 3 ♀.
   (The Yellow-banded Wasp-moth.)
   Syn. *ferox* Walker; *enterpe* Herrich-Schaeffer.
   This species is confined to the southern States along the borders of the Gulf of Mexico. The caterpillar, which according to report feeds upon the *Convolvulaceæ*, remains to be fully described.

(2) **Syntomeida epilais** Walker, Plate XIII, Fig. 2, ♂.
   (The Polka-dot Wasp-moth.)
   The larva has been described by Dyar (see Journal New York Entomological Society, Vol. IV, p. 72, and "Insect Life," Vol. II, p. 360). The caterpillar feeds upon Nerium odoratum.

**Genus PSEUDOMYA Hübner**

This is a small neotropical genus, including, so far as is known, but eight species, one of which occurs in the extreme southern part of Florida.

(1) **Pseudomya minima** Grote, Plate XIII, Fig. 6, ♂.
   (The Lesser Wasp-moth.)
   The caterpillar, which has been described by Dr. H. G. Dyar in "Psyche," Vol. VIII, p. 42, feeds upon Myginda ilicifolia.

**Genus DIDASYS Grote**

Only one species has hitherto been referred to this genus. It is found in Florida.

(1) **Didasys belæ** Grote, Plate XIII, Fig. 7, ♂, Fig. 8 ♀.
   (The Double-tufted Wasp-moth.)
   As shown in our plate, the male has the end of the abdomen ornamented by two tufts, while the female is devoid
of these appendages. The insect is found on the Indian River in Florida, and southward.

**Genus HORAMA Hübner**

Ten species compose this genus, of which only one is found within the limits of the United States.

(i) **Horama texana** Grote, Plate XIII, Fig. 9, ♂. (The Texan Wasp-moth.)

No difficulty should be experienced in identifying this moth by the help of the figure which is given.

**Genus EUCEREON Hübner**

Sixty-two species, all inhabiting the hot lands of North and South America, are assigned by Hampson to this genus. The only one thus far known to occur within the limits of the United States is figured on our plate.

(i) **Eucereon confine** Herrich-Schäffer, Plate XIII, Fig. 10, ♀. (The Floridan Eucereon.)

This interesting little moth, which was described by Henry Edwards under the name *Nelpho carolina*, had been figured by Herrich-Schäffer under the specific name above cited thirty-two years before. It is rare in Florida, but is common in the Antilles, Mexico, and Central America.

**Genus LYMIRE Walker**

This is a small genus comprehending only five species. Its only representant within our borders was originally assigned by Grote to the genus *Scepsis*, which it superficially resembles.

(i) **Lymire edwardsi** Grote, Plate XIII, Fig. 11, ♀. (Edwards' Wasp-moth.)

The larval stages, thanks to the labors of Dr. H. G. Dyar, are known. The caterpillar feeds upon *Ficus pedunculata*. The insect, when pupating, spins a small cocoon of hair and silk. For fuller knowledge upon the subject the reader is referred to "Insect Life," Vol. II, p. 361.

**Genus SCEPSIS Walker**

Three species of this genus, which does not range far into the Mexican territory, are recognized. Two of these we figure;
the third, *Scepsis packardi* Grote, = *matthewi* Grote, is a trifle larger in size, than the other two, much paler in color, and inhabits Washington, Oregon, and British Columbia.

(1) *Scepsis fulvicollis* Hübner, Plate XIII, Fig. 12, ♀. (The Yellow-collared Scape-moth.)

Syn. *semidiaphana* Harris.

This common insect, the larva of which feeds upon grasses, has a wide range from Canada to the Gulf States, and westward to the Rocky Mountains, and southward to Chihuahua in Mexico. The moths frequent the blossoms of the golden-rod (*Solidago*) in the late summer.

(2) *Scepsis wrighti* Stretch, Plate XIII, Fig. 13, ♂. (The White-collared Scape-moth.)

The habitat of this species is southern California. The specimen figured was sent me by Mr. Wright, labeled “Type,” and may be accepted as typical of the species.

**Genus LYCOMORPHA** Harris

A small genus of moths, diurnal in their habits, having a preference for the flowers of the *Composita*, upon which they may frequently be found in their habitats.

(1) *Lycomorpha grotei* Packard, Plate XIII, Fig. 14, ♀. (Grote’s Lycomorpha.)

Syn. *palmeri* Packard.

This pretty little insect occurs in Colorado and thence southward to Texas. So far as recalled by the writer its larval stages have not as yet received attention from any of our American students of the lepidoptera.

(2) *Lycomorpha pholus* Drury, Plate XIII, Fig. 15, ♂.

This common insect, but not the less beautiful because it is common, is widely distributed throughout the United States. The larva is said to feed upon lichens.

**Genus CTENUCHA** Kirby

This genus, which includes about twenty species, is quite well represented in our fauna. Figures of all the species occurring within our territory are given in the plates.

(1) *Ctenucha venosa* Walker, Plate XIII, Fig. 20, ♂. (The Veined Ctenucha.)
Syntomidae

From *Ctenucha cressonana*, its nearest ally, this species may be distinguished by its smaller size, the reddish tint of the stripes upon the fore wings and the edges of the shoulder lappets, and the fact that the fringe opposite the end of the cell on both wings is marked by fuscous, and not uniformly white throughout as in *C. cressonana*. The species ranges from Colorado to Mexico.

(2) *Ctenucha cressonana* Grote, Plate XIII, Fig. 21, ♂.

(Cresson's *Ctenucha*.)

This species, which is one of the largest in the genus, may easily be recognized by the figure we give and the remarks made in connection with what has been said in regard to the preceding species.

(3) *Ctenucha brunnea* Stretch, Plate XI, Fig. 6, ♂. (The Brown-winged *Ctenucha*.)

Easily recognized by the pale brown color of the primaries, upon which the veins stand forth in a darker shade of brown.

(4) *Ctenucha multifaria* Walker, Plate XIII, Fig. 19, ♀.

(The Californian *Ctenucha*.)

This species, which is closely allied to the next, may be discriminated by the fact that the fore wings are lighter in color, the collar is black, not orange spotted with black, as in *C. rubroscapus*, and the costal margin of the primaries is narrowly edged with white.

(5) *Ctenucha rubroscapus* Ménétriés, Plate XIII, Fig. 22, ♀. (Walsingham's *Ctenucha*.)

*Syn. walsinghami* Henry Edwards.

This species, which may be distinguished by the aid of what has been said under the preceding species, as well as by our figure, may have the edges of the shoulder lappets either red, as in our figure, or orange yellow. It is found in the Pacific States.

(6) *Ctenucha virginica* Charpentier, Plate XIII, Fig. 18, ♀.

(The Virginian *Ctenucha*.)

*Syn. latreillana* Kirby.

This moth, which is not at all uncommon in the northern portions of the Appalachian faunal region, may be found in the latitude of New York City and Pittsburgh frequenting the blossoms of blackberries at the end of May and in June. The larva feeds, as do the larvae of the other species, upon grasses.
Genus DAHANA Grote

Only one species, the type of the genus, is known.

(1) Dahana atripennis Grote, Plate XIII, Fig. 23, δ. (The Black-winged Dahana.)

The habitat of this species is southern Florida. The insect does not appear to be common in collections.

FAMILY LITHOSIIDÆ

"You would be another Penelope: yet, they say, all the yarn she spun in Ulysses's absence did but fill Ithaca full of moths."
—Shakespeare, Coriolanus, I, 3.

The moths belonging to this family have the larvæ of the usual form displayed by the Arctiidae, with all of the prolegs present. They feed principally upon lichens. They pupate in cocoons spun up of silk, in which the hairs of the larva are mingled.

The perfect insects, or imagoes, are of medium size or small. As a family, they present many variations in structure, both as to the venation of the wings and secondary sexual characteristics. The following general characterization of the group is taken from Hampson, "Catalogue of the Lepidoptera Phalæna," Vol. II, p. 80:

"Proboscis usually well developed, but often aborted; palpi usually short and porrect, sometimes reaching well beyond the frons, often upturned, rarely reaching above the vertex of the head; antennæ of male usually with bristles and cilia, often bipecticate, sometimes dilated or with tuft of scales on upper side of shaft; ocelli absent; tibiae with the spurs usually moderate, sometimes long or absent. Fore wing typically long and narrow, but in a large section, short and broad, the narrow winged genera having vein 5, and often vein 4, absent. Hind wing with vein 8 coincident with the cell from base to one-third or to near end of cell."

About a dozen genera have thus far been recognized as represented in the fauna of the region of which this book treats.

103
Genus CRAMBIDIA Packard

This small genus, consisting of moths displaying delicate shades of slaty-gray, pale yellow, or pearly white upon their wings, is represented in our fauna by six species, three of which we figure, one of them being hitherto undescribed. The genus falls into two sections, in the first being included those species in which there is no areole in the fore wing, and in the second those which have the areole developed. The first section is represented by Crambidia pallida, and contains, in addition, the species named lithosioides and uniformis by Dyar; the second section is represented by Crambidia casta, and contains, in addition, the species named cephalica by Grote & Robinson, and the species herein described and named allegheniensis. The structure of the insects is sufficiently well set forth in the two cuts we give, which have been kindly furnished by Sir George F. Hampson, with the permission of the Trustees of the British Museum.

(1) Crambidia pallida Packard. (The Pale Lichen-moth.)

The moth is uniformly brownish-grey, with the hind wings a trifle paler than the fore wings. The wings on the under side are lighter than on the upper side. The species occurs in the northern Atlantic States.

(2) Crambidia casta Sanborn, Plate XIII, Fig. 30, $\delta$ (The Pearly-winged Lichen-moth.)

On the under side the fore wings and the costal area of the hind wings are fuscous, and in some specimens the upper side of the wings is also slightly touched with pale fuscous. The insect appears to be not uncommon in Colorado and ranges thence south and north toward the Pacific coast.

(3) Crambidia allegheniensis, sp. nov., Plate XIII, Fig. 31, $\delta$. (The Alleghenian Lichen-moth.)
The head and anterior portions of the thorax are pale yellow. The patagia are of the same color. The thorax and the abdomen on the upper side are pale slaty-gray. The legs and the tip of the abdomen on the under side are ochreous, the middle of the abdomen on the under side being dark slaty-gray. The fore wing on the upper side is slaty-gray, with the costa evenly edged with pale yellow. The hind wings are translucent white. On the under side the wings are marked as on the upper side, but paler. The insect is slightly smaller than casta. It occurs in western Pennsylvania. The type, which is in the collection of the author, was taken by him in East Pittsburgh.

Genus PALPIDIA Dyar

The genus is represented by only one species, so far as is now known.

(i) Palpidia pallidior Dyar. (Dyar's Palpidia.)

This insect, a drawing of the type of which is given in the annexed cut, has the fore wings pale ochreous, with the interspaces between the veins strongly irrorated with dark scales. The hind wings are whitish. It is as yet a rare insect in collections, and has only been recorded from Cocoanut Grove, in Dade County, Florida.

Genus LEXIS Wallengren

The genus Lexis is of moderate size, all of the species referred to it, with the single exception of the one figured on our plate, being inhabitants of the Old World. The metropolis of the genus appears to be southern Asia and the adjacent islands. One species is recorded from Australia, and the species, which is the type of the genus, is found in East Africa.

(i) Lexis bicolor Grote, Plate XIII, Fig. 29, φ. (The Yellow-edged Lexis).

Syn. argillacea Packard.

The moth is pale slaty-grey, with the head, patagia, and anal tuft yellow. The fore wings are bordered on the costa...
with pale yellow, the band of this color running out to nothing before it quite reaches the apex. The specimen figured on the plate came from Colorado. It is also said to occur in Canada and the northern portions of the United States.

**Genus HYPOPREPIA Hübner**

A small genus of North American moths, all the species of which occur within the territory covered by this book. The insects closely resemble each other, and the student who has learned to recognize one of them cannot fail to refer the others correctly to their genus. It is not, however, so easy to discriminate the species. The following little key, which is taken from Hampson's Catalogue, Vol. II, page 515, may help the student in making correct specific references:

1. Ground-color of the fore wing wholly scarlet............miniata
2. Ground-color of the fore wing yellow and crimson........fucosa
3. Ground-color of the fore and hind wings yellow...........cadaverosa
4. Ground-color of the fore wing fuscous brown, of the hind wing whitish........................................inculta

(1) **Hypoprepia miniata** Kirby, Plate XIII, Fig. 41, $\varpi$.
(The Scarlet-winged Lichen-moth.)

*Syn. vitata* Harris; *subornata* Neumoegen & Dyar.

This rather common insect ranges from Canada to the Carolinas and westward in the region of the Great Lakes to Minnesota. It comes freely, as do all the species of the genus, to light, and I have found it very abundant at times about the lamps in the village of Saratoga, New York. I have taken it at Asheville, North Carolina, and at the White Sulphur Springs in West Virginia, but have never received specimens from low altitudes on the Virginian and Carolinian coasts.

(2) **Hypoprepia fucosa** Hübner, Plate XIII, Fig. 42, Ơ.
(The Painted Lichen-moth.)

*Syn. tricolor* Fitch; *plumbea* Henry Edwards.

This species, which may be easily distinguished from the preceding by the fact that the tip of the abdomen is not marked by a dark fuscous spot, and by the narrower marginal band of the secondaries,
as well as by the difference in the color of the wings, is a common species in the Atlantic States, and ranges westward into the basin of the Mississippi.

**Genus Hæmatomis** Hampson

This little genus includes, so far as is now known, but two species, both of which are Mexican, but one of which ranges into southern Arizona. The species are separated as follows by Hampson:

1. Fore wing with yellowish streaks, on costa, through cell, and on inner margin ....................... *mexicana*
2. Fore wing with pale streak on the costa only .................. *uniformis*

(1) *Hæmatomis mexicana* Druce, Plate XIII, Fig. 34, δ.
(The Mexican Lichen-moth.)

With the help of the illustrations we have given the student should have no great difficulty in identifying this little moth.

**Genus Comacla** Walker

This genus is represented in our fauna by two species. One other occurs in Europe and northern Asia, and another in tropical Africa. The two American species are very much alike in appearance, and it is difficult to distinguish worn or rubbed specimens. The following key will be of some assistance:

1. Wings pale mouse gray, translucent; collar and abdomen ochreous; apex of fore wings rounded ....................... *simplex* Walker
2. Wings and body uniformly pale mouse gray, wings translucent only about the middle, sprinkled with blackish scales and marked by an obscure discal dot, apex of fore wings less rounded and more nearly square than in preceding species; *fuscipes* Grote

(1) *Comacla simplex* Walker, Plate XIII, Fig. 34, δ. (The Mouse-colored Lichen-moth.)

Syn. *murina* Walker; *clarus* Grote & Robinson; *texana* French.
The species is common in Texas. *C. fuscipes* occurs in Arizona.

**Genus BRUCEIA Neumöegen**

One species is reckoned in this genus, the structural characters of which are well shown in the cut we give.

1. *Bruceia pulverina* Neumöegen, Plate XIII, Fig. 33, $\delta$. (The Powdered Lichen-moth.)

   Syn. *hubbardi* Dyar.

   The insect named *hubbardi* by Dyar seems to be only a smaller form of *B. pulverina*.

**Genus CLEMENSIA Packard**

To this genus Sir George F. Hampson refers a dozen species. All of these are inhabitants of the hot lands of America, except the species we figure. *Cisthene lactea* Stretch is by Hampson referred to the genus *Illice*. Dr. Dyar places it in the genus *Clemensia*. The species is unknown to the writer, and does not exist in any collection which he has examined, so that we shall not attempt to discuss the vexed question of its proper location.

1. *Clemensia albata* Packard, Plate XIII, Fig. 38, $\delta$. (The Little White Lichen-moth.)

   Syn. *albida* Walker; *cana* Walker; *umbra* Packard; *irrorata* Henry Edwards; *patella* Druce; *philodina* Druce.

   The insect ranges from New England to Mexico and westward to the Pacific coast.

**Genus ILLICE Walker**

This is a moderately large genus comprising nearly thirty species, the most of which are found in tropical America. It has been subdivided into three sections, or subgenera, by Hampson. In the second section, equivalent to *Ozonadia*, a genus erected by Dyar, are placed those species, in which
Explanation of Plate XIII

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Cosmosoma auge Linnaeus, ♂.
2. Syntomeida epilais Walker, ♂.
3. Syntomeida ipomeae Harris, ♀.
5. Triprocris latercula Henry Edwards, ♂, U. S. N. M.
6. Pseudomya minima Grote, ♂, U. S. N. M.
7. Didasys bela Grote, ♂, U. S. N. M.
8. Didasys belae Grote, ♀.
9. Horama texana Grote, ♂.
10. Eucereon confine Herrich-Schaeffer, ♂, U. S. N. M.
11. Lymire edwardsi Grote, ♀.
12. Scepsis julvicollis Hübner, ♀.
13. Scepsis wrighti Stretch, ♂, type.
15. Lycomorpha pholus Drury, ♂.
17. Lycomorpha julgens Henry Edwards, ♀.
19. Ctenucha multifaria Walker, ♀, U. S. N. M.
22. Ctenucha rubroscapusa Ménétries, ♀, U. S. N. M.
23. Dahana atripennis, Grote, ♂.
25. Celama triquetra Fitch, ♀.
26. Celama pustulata Walker, ♂, U. S. N. M.
27. Raselia fuscula Grote, ♀.
28. Psychoglene phrada Druce, ♂.
29. Lexis bicolor Grote, ♂.
30. Crambidia casta Sanborn, ♂.
31. Crambidia allegheniensis Holland, ♂.
32. Nigetia formosalis Walker, ♂.
33. Bruceia pulverina Neumögen, ♂.
34. Comacla simplex Walker, ♂.
35. Illise subjecta Walker, ♂.
36. Illise unifascia Grote & Robinson, ♂.
37. Illise nexa Boisduval, ♂.
38. Clemensia albata Packard, ♂, U. S. N. M.
39. Hæmatomis mexicana Druce, ♂.
41. Hypoprepia miniata Kirby, ♀.
42. Hypoprepia jacoca Hübner, ♂.
43. Kodiosoma eavesi Stretch, ♂.
44. Kodiosoma tricolor Stretch, ♂.
45. Kodiosoma julva Stretch, ♂.
the hind wing is slightly produced at the anal angle. Here come two of the species found in our fauna, *I. schwarziorum* and *I. unifascia*. In the third section, typical *Iliace*, fall the species in which the anal angle is not produced. Here are placed five species. The student may find the following key helpful in determining his specimens:

A. Hind wing slightly produced at the anal angle.
   - Lappets and markings of fore wing yellow, hind wings crimson, fuscous at apex.
     1. Fore wing with the band across the wing crimson on the inner margin. *schwarziorum* Dyar
     2. Fore wing with the band across the wing not crimson on the inner margin. *unifascia* Grote

B. Hind wing not produced at the anal angle.
   - Abdomen crimson; fore wing slaty-gray in ground color.
     1. Fore wing with crimson patch on the costa. *subjecta* Walker
     2. Fore wing without crimson patch on costa, and with a pink streak on the inner margin at the base. *striata* Ottolengui
     3. Fore wing with whitish patch about the middle of the inner margin. *plumbea* Stretch
   - Abdomen orange or yellowish.
     1. Hind wing pale yellow, with apex blackish. *nexa* Boisduval
     2. Hind wing smoky-gray. *faustinula* Boisduval

(1) *Iliace unifascia* Grote & Robinson, Plate XIII, Fig. 36, ♀. (The Banded Lichen-moth.)

*Syn. tenuifascia* Harvey.

The insect ranges from the Ohio Valley southward to Texas, and from Virginia to Florida. The transverse band is often interrupted in the middle of the wing, and there is variation in the color of the hind wings, which, while usually red or crimson, may also be orange, or even yellow.

(2) *Iliace subjecta* Walker, Plate XIII, Fig. 35, ♂. (The Subject Lichen-moth.)

*Syn. packardi* Grote.
Lithosiidae

The distribution of this species is much the same as that of the preceding. Its range is slightly more northern than that of *I. unifascia*.

(3) *Ilice nixa* Boisduval, Plate XIII, Fig. 37, ♀. (The Yellow-blotched Lichen-moth.)

Syn. *grisea* Packard; *deserta* Felder.

This species is found upon the Pacific coast, and is not uncommon in southern California.

Genus PTYCHOGLENE Felder

A small genus confined to the southwestern portions of our territory. The four species occurring within our fauna may be briefly characterized as follows:

1. Head, thorax, base of abdomen, basal two-thirds of primaries and basal half of secondaries bright carmine; black marginal borders of both wings strongly dentate inwardly... *coccinea* Henry Edwards

2. Head, thorax, and abdomen black; fore wings crimson, narrowly edged with black on inner margin, and with a black marginal band covering the wing for about one-fifth of its length, dentate inwardly opposite end of cell. Hind wing blackish-brown, more or less broadly laved with crimson on costal margin... *phrada* Druce

3. Head, thorax, and abdomen black; fore wing crimson, with the costal margin narrowly edged with black; terminal black band of the same width as in the preceding species, but not dentate inwardly. Hind wing pale yellowish crimson, with the outer marginal band strongly toothed inwardly on vein 2... *sanguineola* Boisduval

4. Head, thorax, and abdomen, deep black; patagia crimson; fore wings deep crimson, very narrowly edged on external margin with black, extending on costal margin a short distance from the apex toward the base. Hind wings deep blue-black, very narrowly edged on the costa with crimson, the crimson fascia not quite reaching the apex... *tenuimargo* sp. nov.

(1) *Ptychogene phrada* Druce, Plate XIII, Fig. 28, ♀. (Druce's Lichen-moth.)

Syn. *flammans* Dyar.

(2) *Ptychogene tenuimargo* sp. nov., Plate XIII., Fig. 7, ♀. (The Narrow-banded Lichen-moth.)
The type of this species, which I have received in recent years from Arizona and in great abundance from the State of Chihuahua in Mexico, is figured upon our plate.

**Genus PYGOCTENUCHA Grote**

A small genus containing three species, two of which are found within the limits of the United States. They may be discriminated as follows:

1. Uniformly black, collar-lappets and tip of abdomen ochre-yellow; size small. 
   *funerea* Grote

2. Head, thorax, and abdomen black shot with brilliant blue; fore coxae, tegulae, patagia, and anal tuft scarlet, the latter white in the female; fore wings black shot with green; hind wings black shot with blue. Fully one-third larger than preceding species. 
   *terminalis* Walker

(1) **Pygoctenucha funerea** Grote, Plate XIII., Fig. 40, $\ddot{\sigma}$. 
(The Funereal Lichen-moth.)

The specimen figured on our plate was kindly loaned for the purpose by the Academy of Natural Sciences of Philadelphia. The insect occurs in New Mexico.

(2) **Pygoctenucha terminalis** Walker. (The Blue-green Lichen-moth.)

Syn. *harrisi* Boisduval; *pyrrhoura* Hulst; *votiva* Henry Edwards.

This insect, referred by Hampson to his genus *Protosia*, must be placed here, *Pygoctenucha* having priority over *Protosia*, which falls as a synonym.

**Genus LERINA Walker**

Only one species belongs to this genus. It was originally named by Walker, and made the type of the genus. Subsequently it was redescribed by Boisduval as *Ctenucha robinsoni*, under which name it has passed current in American collections until recently.

(1) **Lerina incarnata** Walker. (The Crimson-bodied Lichen-moth.)

Syn. *robinsoni* Boisduval.

The head, tegulae, and patagia, with the terminal half of the abdomen are deep crimson. The rest of the body and
"Splitters" and "Lumpers"

its appendages are black. The wings are bronzey-green. The insect inhabits Mexico and southern Arizona.

"SPLITTERS" AND "LUMPERS"

Every true naturalist is called upon to exercise the faculty of discrimination and the faculty of generalization. His work trains him to detect dissimilarities on the one hand and likenesses on the other. His judgments as to likenesses are expressed in the genera, the families, the orders, which he proposes. His judgment as to dissimilarities is most frequently expressed in his views as to species. When the two faculties of discrimination and generalization are well balanced and accompanied by the habit of patient observation, ideal conditions are reached, and the work of the naturalist in classification may be expected to stand the test of time. But where, as is often the case, one of these faculties is exalted at the expense of the other, there are certain to result perversions, which will inevitably cause trouble to other students. When a man cultivates the habit of discrimination to excess, he is apt to become, so far as his labors as a systematist are concerned, "a splitter." A "splitter" magnifies the importance of trivial details; he regards minute differences with interest; he searches with more than microscopic zeal after the little things and leaves out of sight the lines of general resemblance. Huber, the celebrated naturalist, said that by patient observation he had come to be able to recognize the different ants in a hill, and, as one by one they emerged from their subterranean galleries, he knew them, as a man living upon a certain thoroughfare in a great city comes at last to know by sight the men and women who are in the habit of daily passing his windows. No doubt the critical eye can detect as great individual differences in the lower animal world as are to be detected among men. A student comes to apply himself with great zeal to searching out and describing these differences, and when he undertakes to say that because of them one form should be separated specifically from another he becomes "a splitter." I recall an entomologist whose chief weapon of research was a big microscope. He would take a minute insect and study it until he was able to number the hairs upon its head. Then he would describe it, giving it a specific name. The next
specimen he would subject to the same critical process, and if
the number of hairs was not just the same, or a small wart was
detected here or there, or a bristle grew in a place where
a bristle did not grow in the specimen previously examined, it
too, was described and a specific name was given it. It was as
if a man, sitting and looking out on the throng upon Broadway,
should resolve to give every individual a specific name and
should declare he had seen as many species of men as he had
seen men passing his window. The labors of such naturalists
may be highly entertaining to themselves, but they are, to say
the least, provocative of unpleasant feelings in the minds of
others who come after them and are compelled to deal with and
review their labors.

The "lumper," on the other hand, is a man who detects no
differences. "All cocoons look alike to me!" he says. Any two
moths which are of approximately the same size and the same
color, are, by him, declared to belong to the same species.
Questions of structure do not trouble him. General re-
semblances are the only things with which he deals. No
matter if eggs, larvæ, legs, veins, and antennæ are different it
is "all one thing" to him. His genera are "magazines," into
which he stuffs species promiscuously. The "lumper" is the
horror of the "splitter," the "splitter" is anathema to the
"lumper"; both are the source of genuine grief and much hard-
ship to conscientious men, who are the possessors of normally
constituted minds and truly scientific habits. Nevertheless, we
are certain to have both "splitters" and "lumpers" in the
camps of science until time is no more. "This kind goeth
not forth" even for "fasting and prayer."

"Look at this beautiful world, and read the truth
In her fair page; see every season brings
New change to her of everlasting youth—
  Stil' the green soil, with joyous living things
Swarms—the wide air is full of joyous wings."

BRYANT.
FAMILY ARCTIIDÆ

"All diamonded with panes of quaint device,
Innumerable of stains, and splendid dyes,
As are the Tiger Moth's deep damask wings."
Keats.

"There is another sort of these caterpillars, who have no certaine place of abode, nor yet cannot tell where to find their foode, but, like unto superstitious Pilgrims, doo wander and stray hither and thither (and like Mise), consume and eat vp that which is none of their owne; and these have purchased a very apt name amongst vs Englishmen, to be called Palmer-worms, by reason of their wandering and rogish life (for they neuer stay in one place, but are ever wandering), although by reason of their roughnes and ruggednes some call them Beare-wormes. They can by no means endure to be dyeted, and to feede vp some certaine herbes and flowers, but boldly and disorderly creepe ouer all, and tast of all plants and trees indifferently, and liue as they list."—TOPSELL, History of Serpents, p. 105 (1608).

This is a large family including many genera and reckoning, according to recent lists, over two thousand species. The family is represented in our fauna by thirty-eight genera, and at least one hundred and twenty species.

The following characterization of the family is adapted from Hampson, with special reference to the genera occurring within our territory:

Proboscis more or less aborted in the typical genera Arctia, Diacrisia, and allies, fully developed in most neotropical genera, and in Utetheisa and its allies; palpi slight and porrect, or well developed and upturned; ocelli present; eyes rarely hairy; antennæ pectinate or ciliate; tibial spurs typically small, but often well developed, the hind tibiae with the medial spurs absent in a few genera and the fore tibiae in others with curved apical claw, the mid and hind tibiae rarely spined. Wings usually well developed. Fore wing with vein 1a separate from 1b; 5 from near lower angle of cell or well below angle of discocellulars; 6 from or from near upper angle; areole present in many genera. Hind wing with vein 1a present; 1c absent:
Arctiidae

4 often absent; 5 from near lower angle of cell or well below angle of discocellulares; 6, 7 sometimes coincident; 8 coincident with the cell from or almost from base to near middle, or extremity of the cell and even in some genera beyond the extremity of the cell. In the genus *Halisidota* vein 8 is obsolete.

The larvæ have all the prolegs and are generally profusely clothed with hairs. They pupate in cocoons woven of silk mixed with the hairs which are shed during the process of spinning. The caterpillars of some species have received the common appellation of “woolly bears,” and the moths are familiarly known as “tiger-moths.”

Genus **HOLOMELINA** Herrich-Schaeffer

The names *Eubaphe* and *Crocota*, proposed by Hübner, and applied recently by some writers to this group of insects, being what are known to students as *nomina nuda*, cannot stand.

It may be said in passing that this genus from a classificational standpoint is in a very unsatisfactory condition, so far as some of the species are concerned. The “Splitters” and the “Lumpers” have been hard at work upon it, and inasmuch as the insects show very little purely structural variation, and vary greatly in color and size, there has resulted great confusion. Within the limits of the space assigned to us in the present compendium we have not the opportunity to discuss these questions, but suggest to our readers that there is here an opportunity to use both eyes and mind to advantage in solving some of the vexed points. The test of breeding should be rigorously applied, and the larval stages of the insects should be critically observed.

(1) **Holomelina ostenta** Henry Edwards, Plate XIV, Fig. 17, 5. (The Showy Holomelina.)

This conspicuous and very beautifully colored insect ranges from Colorado through New Mexico and Arizona into Mexico.

(2) **Holomelina opella** Grote, Plate XIV, Fig. 23, 5. (The Tawny Holomelina.)

*Syn. obscura* Stroeker; *rubricosta* Ehrman.

This species is rather common in Pennsylvania and the Atlantic States as far south as Georgia.
Arctiidae

Form belmaria Ehrman, Plate XIV, Fig. 24, ♀. (Ehrman’s Holomelina.)

This insect, a paratype of which is figured as above cited, is regarded by Dr. Dyar as a varietal form of *H. opella*. The author is inclined to question the correctness of this determination, because all specimens of the moth so far seen, and a considerable series has come under observation, appear to be structurally different from *H. opella*, in so far forth that the fore wings are narrower, longer and more produced at the apex. The mere fact that they are always black in itself could hardly constitute a valid ground for specific discrimination.

3) Holomelina immaculata Reakirt, Plate XIV, Fig. 20, ♂. (The Plain-winged Holomelina.)

The range of this species is the same as that of the preceding.

4) Holomelina diminutiva Græf, Plate XIV, Fig. 22, ♂. (The Least Holomelina.)

Very common in Florida, and apparently quite constant in size and markings. It is sunk as a synonym of *aurantiaca*, form *rubicundaria*, by Dyar, but the writer is not willing to admit that this is correct.

5) Holomelina brevicornis Walker, Plate XIV, Figs. 19, 21, ♀. (The Black-banded Holomelina.)

Syn. *belfragei* Stretch.

This species has also been sunk as a synonym of *aurantiaca* by recent writers, but with doubtful propriety. It is common in the Gulf States and particularly in Louisiana and Texas.

6) Holomelina quinaria Grote, Plate XIV, Fig. 18, ♂. (The Five-Spotted Holomelina.)

Syn. *choriona* Reakirt; *bimaculata* Saunders.

Characterized by the creamy white spots upon the fore wings. The depth of color of the primaries varies much, from dark brown to pale ferruginous, the specimen figured being representative of the latter form. The spots also vary much in size.

“And there’s never a blade nor a leaf too mean
To be some happy creature’s place.”

—Lowell.
Explanation of Plate XIV

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. *Eupseudosoma involutum* Sepp, ♀, U. S. N. M.
4. *Pareuchetes eglenensis* Clemens, ♀.
5. *Opharus astur* Cramer, ♀.
10. *Halisidota caryæ* Harris, ♀.
11. *Halisidota maculata* Harris, ♀.
15. *Æmilia ambigua* Streecker, ♀.
18. *Holomelina quinaria* Grote, ♀.
22. *Holomelina diminutiva* Græf, ♀.
27. *Leptarctia decia* Boisduval, ♀.
29. *Neoarctia beani* Neumœgen, ♀, U. S. N. M.
32. *Diacrisia rubra* Neumœgen, ♀, U. S. N. M.
33. *Diacrisia vagans* Boisduval, ♀.
34. *Diacrisia vagans* Boisduval, ♀.
Genus DODIA Dyar

Only one species has thus far been assigned to this genus. It was named Dodia albertae by Dr. Dyar in the year 1901. The description both of the genus and the species will be found in the Journal of the New York Entomological Society, Vol. IX, p. 85. The annexed cut (Fig. 58) is taken from the type of the species in the United States National Museum. The insect has thus far only been found in the Territory of Alberta.

Genus UTETHEISA Hübner

A genus of small extent, represented both in the Old World and the New by nine species, two of which occur within our territory.

(1) Utetheisa bella Linnaeus, Plate XV, Fig. 27, ♀. (The Beautiful Utetheisa.)

Syn. hybrida Butler; intermedia Butler; terminalis Neumægen & Dyar.

This common moth, which frequents the blossoms of the golden-rod (Solidago) in the late summer and fall, is widely distributed in the States of the Atlantic seaboard, and shows some tendency to local variation.

(2) Utetheisa ornatrix Linnaeus, Plate XVII, Fig. 8, ♂. (The Ornamented Utetheisa.)

Syn. stretchi Butler; pura Butler.

This species may easily be distinguished from the preceding by the washed-out appearance of the primaries. In the form named pura by Butler the fore wings are white, immaculate, except for the red costal streak. The species is common in the Antilles, and occurs in southern Florida.

Genus HAPLOA Hübner

The genus Haploa, which is confined to our territory, has furnished a great deal of amusement to classificationists, who have busied themselves with the spots and markings on the wings of the species, which are very variable. In a long series of specimens of any one of the species it will be found
that scarcely two are exactly alike in the amount of black or white displayed upon the fore wings. The reader will do well in this connection to consult the Proceedings of the United States National Museum, Vol. X, pp. 338-353, where Prof. John B. Smith has written upon the subject, the Canadian Entomologist, Vol. XIX, p. 181 et seq., where Mr. H. H. Lyman has presented his views, and the Plate given by Mr. F. A. Merrick in the Entomological News for 1903, in which the extreme variability of *H. lecontei* in a given locality is illustrated.

(1) **Haploa clymene** Brown, Plate XVII, Fig. 7, δ. (The Clymene Moth.)

*Syn. interruptomarginata* De Beauvois; *comma* Walker.

This is one of the most constant species of the genus, and may easily be recognized by the figure we have given upon the plate. It ranges from southern New England to Georgia, and westward to the Mississippi. The larva feeds upon *Eupatorium* it is said, and the writer believes that the statement, which has been called in question, is correct, for, although he has never reared the larvae to maturity himself, he has observed the female moth ovipositing upon this plant in southern Indiana. It is also said to feed upon willows.

(2) **Haploa colona** Hübner, Plate XVII, Fig. 2, ♀. (The Colona Moth.)

*Syn. carolina* Harris.

*Form consita* Walker, Plate XVII, Fig. 5, δ.

*Syn. lactata* Smith.

This species, which is the largest of the genus, is very variable in the amount of the black shown upon the fore wings. We give two extremes. Other forms are recognized. The insect has its metropolis in the southwestern States, though it occurs also very sparingly in the northern Atlantic States, and more commonly in the southern Atlantic States. It is common in Texas.

(3) **Haploa lecontei** Boisduval (Leconte's Haploa).

*Form dyari* Merrick, Plate XVII, Fig. 9, δ.

*Form militaris* Harris, Plate XVII, Figs. 4, 10, δ; Fig. 1, ♀.

*Form vestalis* Packard, Plate XVII, Fig. 3, ♀.
Arctiidae

This is a protean species, of which a half dozen, or more, forms have been recognized, named, and described. We give in our cut (Fig. 59), a figure of the wings of a specimen, which agrees in its markings with the specimen figured by Boisduval, the author of the species, in his Plate given in the Regne Animal. Such specimens come in the form of their maculation very near the next species, which has been differentiated by Lyman under the name confusa. Haploa lecontei ranges from New England to Georgia and westward to the Mississippi. It is a very common insect in western Pennsylvania. The caterpillar feeds upon Triosteum perfoliatum, and in localities where this plant is abundant the moths may be found in swarms at the end of May and the beginning of June.

(4) Haploa confusa Lyman, Plate XVII, Fig. 6, δ. (Lyman’s Haploa.)

This form, or species, is well represented in our plate. It appears to be constant, and is indigenous to the New England States. The specimen figured came from the neighborhood of Claremont, New Hampshire.

(5) Haploa contigua Walker. (The Neighbor.)
The cut we give (Fig. 60), shows the maculation of the wings of this species sufficiently well to enable it to be separated at once from its congeners. It occurs in the Atlantic region from New England northward and westward. It is found in the Catskills and the Adirondacks, and probably occurs in the mountains of northern Pennsylvania, although I do not recall any reference to its having been taken in that State, nor have I seen it on the Alleghenies, where I have passed several summers.

Genus EUERYTHRA Harvey

There are two species of this genus known, Euerythra phasma Harvey, which is represented in the accompanying cut
Arctiidae

(Fig. 61), and Euerythra trimaculata, which is figured on Plate XVI, Fig. 4. The insects occur in Texas and Arizona. They are not common in collections as yet, and so far as the writer recalls, their larval habits have not been described. The student who desires to study the structure of the genus should consult Hampson’s Catalogue, or Prof. Smith’s Paper published in the Proceedings of the United States National Museum, Vol. X, p. 335 et seq.

Genus ECPANTHERIA Hübner

This is a large genus, well represented in the tropics of America. Only two species occur within the limits of our fauna, Ecpanttheria muzina Oberthür, which is found in Texas as a straggler from the Mexican territory, and Ecpanttheria deflorata Fabricius, which is more commonly known by its synonymical name, scribonia, given to it by Stoll. The larva of this handsome moth is itself a beautiful object. It is deep black, clothed with black hairs, and at the junction of the somites, or segments of the body, it is banded with rings of crimson. The male of the perfect insect is figured on Plate XVI, Fig. 16, and in the accompanying cut we give a figure of the larva. The Eyed Tiger-moth ranges from southern New England, where it is rare, through the southern parts of the United States into Mexico. It is quite common in the Carolinas, and in my boyhood I derived much pleasure from rearing the larvae, which fed very freely upon the plantain (Plantago).
Genus TURUPTIANA Walker

There are eight species in this genus, but only one of them occurs within the limits of the United States.

(i) Turuptiana permaculata Packard, Plate XVI, Fig. 15, \( \delta \). (The Many-spotted Tiger-moth.)
Syn. reducta Grote; cæa Strecker.

This neat moth is found in Colorado and thence southward as far as Arizona and Mexico.

Genus LEPTARCTIA Stretch

There is only one species in this genus, but the single species by assuming protean colors has caused a great multiplication of names. We have figured a few of the varietal forms.

(i) Leptarctia californiæ Walker, Plate XIV, Fig. 25, \( \varphi \).
Form lena Boisduval, Plate XIV, Fig. 28, \( \delta \).
Form decia Boisduval, Plate XIV, Fig. 27, \( \delta \).
Form dimidiata Stretch, Plate XIV, Fig. 26, \( \delta \).
The moth is found in southern California, where it is quite common. The student will have little trouble in recognizing the commoner varieties by the help of the figures we have given, but these are only a few of the forms which occur.

"And with childlike credulous affection
We behold those tender wings expand,
Emblems of our own great resurrection,
Emblems of the bright and better land."

—LONGFELLOW.
Genus SEIRARCTIA Packard

(1) **Seirarctia echo** Abbot & Smith, Plate I, Fig 10, larva; Plate XVI, Fig. 23, ♀. (The Echo Moth.)

Syn. *niobe* Strecker.

This beautiful moth, the caterpillar of which feeds upon the sabal palmetto, occurs in Florida, Georgia, Alabama, and Mississippi.

Genus ALEXICLES Grote

(1) **Alexicles aspersa** Grote. (The Alexicles Moth.)

This moth is referred by Hampson to *Hyphantria*. It may belong there, but I leave it in the genus erected for it by Grote. The abdomen is vermilion-colored, with black dorsal spots. The wings are dark brown, the primaries somewhat lighter than the secondaries and showing obscure darker spots, arranged in transverse bands.

Genus ESTIGMENE Hübner

There are reputed to be four species of this genus found within the United States. *Albida* Stretch is possibly only an extreme white variation of *E. acræa*. *E. prima* Slosson is represented in Fig. 66. It is found in the New England States, northern New York, and Canada. The three species just named all agree in having the abdomen yellowish or orange above, and ornamented dorsally by a series of black
Explanation of Plate XV

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. *Apantesis rectilinea* French, ♀, U. S. N. M.
3. *Apantesis determinata* Neumegen, ♂.
5. *Arctia caia* Linnaeus, ♀.
6. *Apantesis phalerata* Harris, ♂.
8. *Apantesis persephone* Grote, ♂.
10. *Apantesis persephone* Grote, ♀.
12. *Apantesis figurata* Drury, ♀, U. S. N. M.
15. *Apantesis arge* Drury, ♀.
16. *Apantesis virguncula* Kirby, ♀, var.
17. *Apantesis michabo* Grote, ♀.
22. *Apantesis vittata* Fabricius, ♀.
25. *Apantesis vittata* Fabricius, ♂.
spots. *E. congrua* has the abdomen white on the upper side. The genus is represented in Asia, Africa, and Tasmania, as well as in the temperate regions of North America.

(1) **Estigmene acræa** Drury, Plate, XVI, Fig. 11, 6, Fig. 12, 9. (The Acraea Moth.)

*Syn. caprotina* Drury; *meunstrina* Martyn; *pseudervinea* Peck; *californica* Packard; *packardi* Schaupp; *klagesi* Ehrman.

A western variety with the fore wings slightly shaded with brown has been dubbed *dubia* by Walker, and *ricksecheri* by Behr. In Mexico there is a local race in which the males have the hind wings white like the females, and to this race Hampson has applied the name *mexicana*. This is altogether one of

![Fig. 67.—Estigmene acræa, 6. 4. (After Hampson.)](image)

the commonest insects in the Middle Atlantic States, and with the illustrations we have given can be easily determined.

(2) **Estigmene congrua** Walker, Plate XVI, Fig. 8, 6. (The white-bodied Estigmene.)

*Syn. antigone* Strecker; *athena* Strecker.

A fairly common species in Pennsylvania and the Atlantic States generally, ranging westward as far as Colorado.

**Genus HYPHANTRIA Harris**

This small genus contains only three or four species, one of which is South African.

(1) **Hyphantria cunea** Drury. (The Fall Web-worm Moth.)

*Form punctatissima* Abbott & Smith, Plate XVI, Fig. 10, 6.*

*The specimens used on Plate XVI, Figs. 10 and 7, both unfortunately developed grease on their abdomens between the time when they were set up for the photographer, and the time when they were photographed. The abdomen in both cases is normally white, with darker markings.*
Arctiidæ

Form pallida Packard, Plate XV, Fig. 26, ♂.
The larvae are social in their habits, and spin great webs upon the foliage of almost all kinds of deciduous trees in the late summer and fall, and do a great deal of damage to orchards and nurseries. The insects pupate in loose cocoons, in crannies, and even under the loose surface of the soil. The species ranges over the United States from southern New England and New York to Texas and further west.

(2) Hyphantria textor Harris, Plate XVI, Fig. 9, ♂. (The Spotless Fall Web-worm Moth.)
This species, which is closely allied to the preceding in its habits, may be distinguished by the white antennæ, and the un-spotted abdomen. There are specimens of the preceding species, which have the wings as immaculate as in H. textor. The range of the insect is from Canada to the Gulf, and from Nova Scotia to California.

Genus ARACHNIS Geyer

A small genus containing eight or nine species found in the southwestern States of the American Union, Mexico, and Central America.

(1) Arachnis aulæa Geyer, Plate XVI, Fig. 1, ♂. (The Aulæan Tiger-moth.)
Syn. incarnata Walker.
The insect occurs in southern Arizona and ranges thence southwardly as far as Guatemala. The larval stages have been described by Dyar in the Canadian Entomologist, Vol. XXVI, p. 307.

(2) Arachnis picta Packard, Plate XVI, Fig. 2, ♂. (The Painted Arachnis.)
Names have been applied to a number of color varieties of this insect. It ranges from Colorado to southern California and northern Mexico. The larva feeds upon Lupinus.

(3) Arachnis zuni Neumoegen, Plate XVI, Fig. 3, ♀. (The Zuni Tiger-moth.)
The figure we give will enable the student to recognize this pretty and rather rare species without any difficulty. It ranges from New Mexico to Arizona and southward on the tablelands.
Genus ISIA Walker

Three species belong to this genus, one found in Argentina, the other in Turkestan, and the third in the United States and Canada.

Fig. 68—Isia isabella, ♂. ♀. (After Hampson.)

(i) Isia isabella Abbot & Smith, Plate XVI, Fig. 13, ♂. (The Isabella Tiger-moth.)

This common insect is found everywhere in the United States. The caterpillar is the familiar "woolly bear," which may be often seen by the roadside rapidly making its way in the fall of the year to a hiding-place in which to hibernate, or, in the spring, to some spot where it may find food. It is reddish-brown in color, black at either end. When disturbed, it curls up and lies motionless, as if feigning death. To "caterpillar," in the slang phrase of the Middle West, is to silently succumb and yield to the unavoidable. The larva feeds freely upon a great variety of herbaceous plants. It is fond of the grasses, and particularly likes the leaves of the plantain (Plantago). There does not appear to be any marked tendency to variation in this species. Both the moth and the larva are common objects, with which every American schoolboy who has lived in the country

Fig. 69.—Isia isabella. a. larva; b. pupa.
Arctiidae

is familiar; and unhappy is the boy who has not at some time or other in his life made the country his home. “God made the country, man made the town.”

Genus PHRAGMATOBIA Stephens

A genus of modern extent, represented in Europe, Asia, and North America. The structural characteristics of the wings are displayed in Fig. 71.

(1) Phragmatobia fuliginosa Linnaeus, Plate XIV, Fig. 31, ♀. (The Ruby Tiger-moth.)
   Syn. rubricosa Harris.

The Ruby Tiger-moth is widely distributed, being found throughout boreal Asia, Europe, and the northern United States and Canada. A multitude of minor subvarietal forms have been distinguished, and to some of them names have been applied, but there is comparatively little difference between them, and the student who has once learned to recognize the species will find no difficulty in assigning to it any specimens which may come into his possession. The insect, so far as our fauna is concerned, is a northern species, quite common in New England and Canada, and ranging southward along the Appalachian Mountains into the Carolinas, where it only occurs at high elevations above sea-level. It is also found ranging southward along the Rocky Mountains. The caterpillar feeds upon a variety of herbaceous plants, and is partial to the shoots of the goldenrod (Solidago).

(2) Phragmatobia brucei Henry Edwards, Plate XIV, Fig. 30, ♂. (Bruce’s Tiger.)

This species is found in Colorado upon the mountains.

(3) Phragmatobia beani Neumögen, Plate XIV, Fig. 29, ♀. (Bean’s Tiger-moth.)
The habitat of this species is the Rocky Mountains of Alberta and Assiniboia.

(4) Phragmatobia yarrowi Stretch. (Yarrow's Tiger-moth.)
Syn. remissa Henry Edwards.

This pretty little tiger-moth is found from the country south of Hudson Bay to British Columbia, and ranges thence southward along the higher mountain ranges as far as northern Arizona.

Genus MÆNAS Hübner

Only one species of this rather extensive genus, which is represented in South America by five species and by a considerable number in Africa and the Indo-Malayan region, occurs in North America.

(1) Mænas vestalis Packard, Plate XVI, Fig. 5, 3. (The Vestal Tiger-Moth.)

This insect, which closely resembles Estigmene congrua, figured on the same plate, may be distinguished from the latter not only by structural peculiarities, but unfailingly by the ordinary observer, by the presence of the two black spots on the hind wings, as shown in our illustration.

Genus DIACRISIA Hübner

This large genus, which includes over one hundred and twenty-five species, according to the arrangement given in Hampson's Catalogue, not reckoning the species referred to the genus Isia, which he also places here, is represented in our fauna by four insects, of which we give illustrations.

(1) Diacrisia virginica Fabricius. Plate XVI, Fig. 7, 3. (The Virginian Tiger-moth.)

The form figured on our plate is the slight variety named fumosa by Strecker, in which the fore wings are a little dusky at their tips as if they had been flying about in the smoke of the furnaces at Reading or Pittsburgh. Ordinarily the species
Arctiidae

is pure white. The body of the specimen on our plate is greasy, and hence too dark.

(2) Diacrisia latipennis Stretch, Plate XVI, Fig. 6, ♂.
(The Red-legged Diacrisia.)
The coxae and femora are pink or reddish. The insect is common in Pennsylvania, and the Atlantic States generally.

(3) Diacrisia rubra Neumöegen, Plate XIV, Fig. 32, ♀.
(The Ruddy Diacrisia.)
The habitat of this species is British Columbia, Oregon, and Washington.

(4) Diacrisia vagans Boisduval, Plate XIV, Fig. 33, ♂, Fig. 34, ♀.
(The Wandering Diacrisia.)
Syn. pteridis Henry Edwards; bicolor Walker; rufula Boisduval; punctata Packard; proba Henry Edwards.
The insect illustrates the phenomenon of sexual dimorphism, the males and females being unlike in color. The species-makers have had some sport with it, as shown by the synonyms.

Genus HYPHORAIA Hübner

This is a sub-arctic genus, circumpolar in its distribution in the Northern Hemisphere. Three species occur in our territory, one of which we figure.

(1) Hyphoraia parthenos Harris, Plate XVI, Fig. 20, ♀.
(The St. Lawrence Tiger-moth.)
Syn. borealis Moeschler.
The moth, which is one of the most beautiful in the family, is comparatively rare in collections. It occurs in northern New England, and the valley of the St. Lawrence, westward to Manitoba. It is occasionally found in the Catskills.

Genus PLATYPREPIA Dyar

One species is found in our region. It is somewhat variable in the style and number of the spots upon the wings.

(1) Platyprepia virginalis Boisduval, Plate XV, Fig. 18, ♂. Fig. 19. ♀.
(The Ranchman’s Tiger-moth.)
Syn. ochracea Stretch; guttata Boisduval.
A very beautiful insect, quite common in Colorado, Wyoming, and Montana, and thence ranging westward to northern California and the region of Puget’s Sound.
Genus APANTESIS Walker

The metropolis of this genus is North America, only two species attributed to it being found in the Old World. There are over twenty valid species found within our limits, and numerous so-called subspecies and varietal forms. A small treatise might be written upon these, but in a volume like this, which is designed to cover in as compact form as possible the most needed information, all that we can do is to help the student to the determination of the more important species.

(1) Apantesis virgo Linnaeus, Plate XV, Fig. 11, ♂.
(The Virgin Tiger-moth).

Found in the northern Atlantic States and Canada.

(2) Apantesis parthenice Kirby, Plate XV, Fig. 13, ♂.
(The Parthenice Moth.)

Syn saundersi Grote.
The habitat of this species is the same as that of A. virgo, from which it may always be discriminated by its smaller size, the narrower white lines upon the fore wings and the absence of the dark spot at the origin of vein two on the hind wings, which is characteristic of the former species.

(3) Apantesis intermedia Stretch, Plate XI, Fig. 20, ♂.
(The Intermediate Tiger-moth.)

This species which is by some authors regarded as a southern form of A. parthenice, is intermediate in size between A. virgo and A. parthenice. It closely resembles the latter in the maculation of the wings, but the pinkish-white stripes on the primaries are broad as in A. virgo.

(4) Apantesis oithona Strecker, Plate XVI, Fig. 30, ♂.
(The Oithona Moth.)

This insect is undoubtedly genetically the same as A. rectilinea French. The difference is merely in the width of the pale lines on the fore wings, which, being narrower in rectilinea, give these wings a darker appearance.

Form rectilinea French, Plate XV, Fig. 1, ♀. (The Straight-lined Tiger-moth.)

This insect in its varietal forms ranges from the Atlantic States across the Mississippi Valley.

129
Arctiidae

(5) Apantesis michabo Grote, Plate XV, Fig. 17, ♂. (The Michabo Moth.)
   Syn. minea Slosson.
   The illustration we give is sufficient to enable the student to identify this species, which is discriminated from its con-
geners most readily by observing the broad flesh-colored band on the costa of the fore wings. In the form minea the flesh-
colored lines are deep-red. This is the only difference.

(6) Apantesis arge Drury, Plate XV, Fig. 15, ♂. (The Arge Moth.)
   Syn. dione Fabricius; incarnatorubra Goeze; calcbs Martyn; nerea Boisduval; doris Boisduval.
   Allied to the preceding species, but ascertained by the test of breeding to be distinct. The species is very variable. The
hind wings are not often as free from dark markings as the specimen, and frequently are as much spotted and blotched with
black as is the figure of A. michabo we give. The species is found almost everywhere within the United States and Canada.

(7) Apantesis ornata Packard. (The Ornate Tiger-moth.)
   Form achaia Grote & Robinson, Plate XV, Figs. 20, 24, ♂. (The Achaia Moth.)
   Syn. edwardsi Stretch.
   A variable insect to which a number of names have been given. The variety in which the hind wings are yellow is
A. ochracea Stretch. The species is found on the Pacific coast. The larval stages have been described by Dyar, Psyche,

(8) Apantesis anna Grote. (The Anna Moth.)
   Form persephone Grote, Plate XV, Fig. 8, ♂, Fig. 10, ♀. (The Persephone Moth.)
   We give in Figure 72 a cut representing a specimen of the
typical anna, in which the hind wings are wholly black. Persephone is the normal form. The insect is very variable in
the amount of black displayed upon the hind wings, and also to some extent in the width and extent of the light lines on the
primaries. The species is found in the Atlantic States, and is
not at all uncommon in western Pennsylvania. The larva has been described by Dyar.

(9) *Apantesis quenseli* Paykull, Plate XVI, Fig. 28, ♀. (The Labrador Apantesis.)

Syn. *strigosa* Fabricius; *gelida* Moeschler; *liturata* Ménétriers; *compli-cata* Walker; *turbans* Christoph.

This little moth is found in Labrador, Greenland, and Arctic America generally. It also occurs in Arctic Europe and Asia and upon the summits of the Swiss Alps. It doubtless will be found upon the American Alps in British Columbia.

(10) *Apantesis virguncula* Kirby, Plate XV, Fig. 9, ♂, Fig. 16, ♀. (The Little Virgin Moth.)

Syn. *dahurica* Grote (ne Boisduval); *speciosa* Moeschler; *otiosa* Neumœgen & Dyar.

A variable species. The form described as *otiosa* has traces of the transverse lines, characteristic of so many other species of the genus, and the fore wings have a more checkered appearance on this account. The insect occurs in the northern United States and Canada.

(11) *Apantesis proxima* Guérin-Méneville, Plate XV, Fig. 4, ♀. (The Mexican Tiger-moth.)

Syn. *docta* Walker; *mexicana* Grote & Robinson; *arizonensis* Stretch; *mormonica* Neumœgen.

Form *autholea* Boisduval, Plate XVI, Fig. 32, ♀.

From the varietal form *autholea* figured in the plate *proxima* may be discriminated by the fact that the latter has the hind wings marked with dark brown or black spots on the margins. The species occurs in southern California, Arizona, Mexico, and Central America.

(12) *Apantesis blakei* Grote, Plate XVI, Fig. 31, ♂. (Blake's Tiger-moth.)

Syn. *bolanderi* Stretch.

This species is found in the mountains of California and adjoining States.

(13) *Apantesis nevadensis* Grote & Robinson, Plate XVI, Fig. 29, ♂. (The Nevada Tiger-moth.)

Syn. *behri* Stretch.

Form *incorrupta* Henry Edwards, Plate XV, Fig. 7, ♀.

Syn. *shastaënsis* French.
Arctiidae

As the name indicates, this species is an inhabitant of the Rocky Mountains.

(14) *Apantesis williamsi* Dodge. (Williams’ Tiger-moth.)
Form *determinata* Neumoegen, Plate XV., Fig. 3, ♂.
Syn. *diecki* Neumoegen.
This easily recognized species is found in Colorado and adjacent States among the mountains.

(15) *Apantesis phyllira* Drury, Plate XV, Fig. 14, ♂.
(The Phyllira Moth.)
Syn. *B-atra* Goze; *plantaginis* Martyn; *dodgei* Butler; *extensa* Neumoegen; *favorita* Neumoegen; *lugubris* Hulst.
This species is found in the Southern States, where it is not uncommon. It is rather variable in the disposition and extent of the dark and light markings.

(16) *Apantesis figurata* Drury, Plate XV, Fig. 12, ♀.
(The Figured Tiger-moth.)
Syn. *ceramica* Hübner; *f-pallida* Streecker
This is probably only a form of the preceding species, which occurs with considerable frequency. It is confined to the Southern States.

(17) *Apantesis vittata* Fabricius, Plate XV, Fig. 25, ♂, Fig. 22, ♀. (Banded Tiger-moth.)
Syn. *decorata* Saunders.
Form *radians* Walker, Plate XV, Fig. 23, ♂, Fig. 21 ♀.
Syn. *colorata* Walker; *incompleta* Butler.
Form *phalerata* Harris, Plate XV, Fig. 6, ♀.
Syn. *rhoda* Butler.

A very common and variable species, which is probably the same as *A. nais* Drury, which has the abdomen prevalently ochraceous, and not as strongly marked with black. The species seems to be, so to speak, in a liquid state. In a series of some hundreds of specimens before the writer, many of them bred from larvae, and undoubtedly all referable to the same species, any and all of the forms, which have been named by writers, can be found, yet the bulk of them came from one narrow little ravine in western Pennsylvania. We leave the synonymy as it stands in Dyar’s list, so far as the things figured on our plate are concerned, but cannot believe that these insects represent different species, as maintained by some authors.

132
Genus KODIOSOMA Stretch

This little Californian genus, the structure of which is abundantly illustrated by the cut we give, contains but one species, which is represented in a number of varietal forms.

(1) Kodiosoma fulva Stretch, Plate XIII, Fig. 45, ♂.
Form eavesi, Stretch, Plate XIII, Fig. 43 ♂.
Form tricolor Stretch, Plate XIII, Fig. 44, ♂.

There are still other forms, one of which is wholly black, and has been named nigra by Stretch. The moth is found in California, and is there not at all uncommon. The life-history has been thus far only imperfectly ascertained.

Genus ECTYPIA Clemens

Two species are referred to this genus. E. thona Strecker, from New Mexico is doubtfully referable to it, but the only specimen known, the type, is in too poor a condition to enable much to be told about it.

(1) Ectypia bivittata Clemens. (The Two-banded Ectypia.)

Syn. nigroflava Gräf.

This very beautiful and rare moth occurs in Texas. Its characteristics are well displayed in the figure we give in the accompanying cut.

Genus EUVERNA Neumægen & Dyar

(1) Euverna clio Packard, Plate XVI, Fig. 22, ♀. (The Clio Moth.)

This chastely beautiful moth occurs in the Rocky Mountains of southern California. It is the sole representative of its genus and is as yet rare in collections.
Arctiidae

Genus PARASEMIA Hübner

This genus is represented in our fauna by certain varietal forms, which agree in part with those found in the Old World, and in part differ from them. There is only one species in the genus, which has a wide circumpolar distribution, and a score or more of names have been given to mere color varieties. We figure two of the commoner variations. The larva feeds on Plantago and Myosotis.

(i) Parasemia plantaginis Linnaeus. (The Small Tiger-moth.)
Plate XVI, Fig. 25, ♂. The usual form found in Colorado and Wyoming.
Plate XVI, Fig. 26, ♂. Form named geometrica by Grote.

Genus ARCTIA Schrank

A circumpolar genus of the Northern Hemisphere, containing four species, which are subject to considerable variation in color and size of spots.

(1) Arctia caia Linnaeus, Plate XV, Fig. 5, ♀. (The Great Tiger-moth.)
The specimen figured on the plate was taken in Labrador.
Form wiskotti Staudinger, Plate XV, Fig. 2, ♀.
Syn. utahensis Henry Edwards; auripennis Butler; transmontana Neumügen & Dyar.
The specimen portrayed on the plate was taken in Colorado.

Genus PAREUCHÆTES Grote

There are three species of this genus, two of which we figure. The species may be discriminated as follows:

1. Hind wing yellowish..........................insulata
2. Hind wing white..................................tenera
3. Hind wing tinged with fuscous...............eglenensis

(1) Pareuchætes insulata Walker, Plate XIV, Fig. 3, ♀.
(The Yellow-winged Pareuchætes.)
Syn. cadaverosa Grote; affinis Grote; aurata Butler.
Found in the Gulf States and the Antilles.

(2) Pareuchætes eglenensis Clemens, Plate XIV, Fig. 4, ♀.
(The Gray-winged Pareuchætes.)
Explanation of Plate XVI

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Arachnis aulca Geyer, ♀.
2. Arachnis pica Packard, ♂.
3. Arachnis zuni Neumögen, ♀, U. S. N. M.
4. Eurythra trimaculata Smith, ♂.
5. Maenas vestalis Packard, ♂.
6. Diacrisia latipennis Stretch, ♂.
7. Diacrisia virginica Fabricius, ♂.
11. Estigmene acrae Drury, ♂.
12. Estigmene acrae Drury, ♀.
13. Isia isabella Abbot & Smith, ♀.
15. Turiptiana permaculata Packard, ♂.
16. Ecpantheria deflorata Fabricius, ♂.
17. Pygarctia elegans Stretch, ♂.
18. Pygarctia spraguei Grote, ♂.
20. Hyphoraia parihenaos Harris, ♀, U. S. N. M.
22. Ewerna clio Packard, ♀.
23. Sererctia echo Abbot & Smith, ♀.
25. Parasemia plantaginis Linnaeus, ♀, U. S. N. M.
26. Parasemia plantaginis var. geometrica, Grote, ♂.
27. Pygarctia abdominalis Grote, ♀, U. S. N. M.
28. Apantesis quensel Paykull, ♂.
29. Apantesis nevadensis Grote & Robinson, ♂, U. S. N. M.
30. Apantesis oithona Strecker, ♂, Engel Collection.
31. Apantesis blakei Grote, ♂, U. S. N. M.
32. Apantesis proxima var. autholea, Boisduval, ♂.
This species occurs in the Carolinas and southward. *Pareuchætes tenera* is found in the Atlantic States and is not uncommon in Pennsylvania.

**Genus EUCHÆTIAS Lyman**

The following key based upon that of Hampson may enable the student to differentiate the species in his collection:

Abdomen red above.
- Fore wing with costal fascia.
  - Fore wing with the costal fascia yellow.............*antica* Walker
  - Fore wing with the costal fascia white............*albicosta* Walker
- Fore wing without costal fascia.
  - Hind wing with crimson patch on inner area........*perlevis* Grote
  - Hind wing without crimson patch on inner area.
  - Fore wing uniform brownish....................*murina* Stretch
  - Fore wing white tinged with fuscous................*bolleri* Stretch

Abdomen orange above.
- Fore wing gray-brown.............................*egle* Drury
  - Fore wing brownish white with the veins white...*oregonensis* Stretch

Abdomen whitish above..............................*pudens* Henry Edwards

(1) *Euchætias murina* Stretch, Plate XI, Fig. 18, ♀. (The Mouse-colored Euchætias.)

The habitat of this species is Texas.

(2) *Euchætias egle* Drury, Plate I, Fig. 5, larva; Plate XVI, Fig. 21, ♀. (The Milk-weed Moth.)

![Diagram](https://example.com/diagram.png)

**Fig. 75.**—*Euchætias egle*, ♂ ♀. (After Hampson.)

The figure given above in the text and those given on the plates will suffice for the identification of this common insect, which ranges from the Atlantic to the Mississippi and beyond. The larva feeds upon Milk-weed (*Asclepias*).

(3) *Euchætias oregonensis* Stretch, Plate XVI, Fig. 19, ♂. (The Oregon Euchætias.)

This insect is found throughout the northern portions of the United States and Canada.
Genus PYGARCTIA Grote

A small genus containing four species all found within our territory. The following table taken from Hampson will serve for the identification of the species, taken in connection with the cut and the figures we give:

A. Fore wing with scarlet fasciae on costa and inner margin... spraguei
B. Fore wing with orange fasciae on costa and inner margin
   a. Abdomen scarlet....................... vivida
   b. Abdomen orange...................... abdominalis
C. Fore wing without fasciae.................. elegans

(1) Pygarctia elegans Stretch, Plate XVI, Fig. 17, ♂. (The Elegant Pygarctia.)

The neuration and structural characteristics of the genus are sufficiently well displayed in the accompanying cut of this species to make any verbal description unnecessary. The insect occurs in southern California, Texas, Arizona, and Mexico.

(2) Pygarctia abdominalis Grote, Plate XVI, Fig. 27, ♀. (The Orange-bodied Pygarctia.)

The habitat of this species is Florida.

(3) Pygarctia spraguei Grote, Plate XVI, Fig. 18, ♂. (Sprague's Pygarctia.)

The home of this insect is Kansas, Colorado, and adjoining States.

Genus HYPOCRISIAS Hampson

A small genus of which a single representant is found within our limits, occurring as a straggler from the Mexican fauna.

(1) Hypocrisias minima Neumægen.

(The Least Hypocrisias.)

Syn. armillata Henry Edwards.

The prevalent tints of the body and fore wings are ochreous and brown. The hind wings are yellowish white. The annexed cut will help the student to recognize the insect, when a specimen comes into his possession. The habitat of the species is Mexico, but it is occasionally taken in southern Arizona.
Genus ÆMILIA Kirby

A small neotropical genus, represented in our fauna by two species. The insect named occidentalis by French is a form of A. roseata, in which the red of the wings has been replaced by ochreous.

(1) Æmilia ambigua Strecker, Plate XIV, Fig. 15, ♂. (The Red-banded Æmilia.)

Syn. bolieri Henry Edwards; syracosia Druce.

This beautiful insect is found in the Rocky Mountains of Colorado, and thence southward to northern Mexico.

(2) Æmilia roseata Walker, Plate XIV, Fig. 14, ♀. (The Rosy Æmilia.)

Syn. cinnamomea Boisduval; sanguivenosa Neumoegen; significans Henry Edwards; occidentalis French.

This rather rare insect occurs on the Pacific coast, and, according to report, ranges from British Columbia to Mexico. The specimen figured on the plate came from the latter country.

Genus HALISIDOTA Hübner

An extensive genus, well represented in Central and South America, and containing about a dozen species, which are found within our faunal limits. Of these we figure a number of species, enough to enable the student to recognize the genus, and the commoner species, which he is likely to encounter.

(1) Halisidota tessellaris Abbot & Smith, Plate XIV, Fig. 12, ♂. (The Tessellated Halisidota.)

Syn. antiphola Walsh; harrisi Walsh.

The form named Harrisi does not differ from tessellaris in the imaginal stage. The sole difference is in the color of the pencils of hairs in the larva, which are orange in color, while in tessellaris they are black. This is scarcely sufficient ground upon which to establish a species.

(2) Halisidota cinctipes Grote, Plate XIV, Fig. 13, ♂. (The Gartered Halisidota.)

Syn. davisi Henry Edwards.

This species, which is southern in its habitat, and larger than its close northern ally, tessellaris, has the markings on the fore wings much more distinct than is the case in the latter
Arctiidae

species. The tarsi are annulated with black bands, marked with small gray points. The insect occurs in the Gulf States and in South and Central America.

(3) Halisidota maculata Harris, Plate XVI, Fig. 11, ♂. (The Spotted Halisidota.)

Syn. fulvoflava Walker; guttifera Herrich-Schaeffer.

This species, which occurs in the northern portions of the Atlantic coast region, ranges westward to California. Several forms from the western territory have been discriminated by writers, and varietal names have been given to them. They are mere color forms.

(4) Halisidota longa Grote, Plate XIV, Fig. 16, ♀. (The Long-streaked Halisidota).

This species, which may easily be determined by the help of the figure we have given, occurs in Florida. The specimen delineated by the writer was taken by him at light in Jacksonville in the month of February.

(5) Halisidota caryæ Harris, Plate XIV, Fig. 10, ♂. (The Hickory Halisidota.)

Syn. annulifascia Walker; porphyria Herrich-Schaeffer.

This well-marked and easily identified species is common in the northern Atlantic coast region, and ranges westward into the valley of the Mississippi.

(6) Halisidota argentata Packard, Plate XIV, Fig. 8, ♂, Fig. 9, ♀. (The Silver-spotted Halisidota.)

This pretty species is found in Colorado, and thence westward and northward to the Pacific coast. A number of subspecies have been named in this connection, but it is doubtful whether the sexes of the insects on meeting each other would recognize any specific differences themselves.

Genus HEMIHYALEA Hampson

Two species of this genus occur within the limits of the United States. Edwardsi is distinguished from labecula most easily by the fact that the inner margin of the secondaries in the former is crimson, while in the latter it is not.

(1) Hemihyalea edwardsi Packard, Plate XIV, Fig. 6, ♀. ‘Edwards’ Glassy-wing.)

Syn. translucida Walker; quercus Boisduval.

This is a Californian species.
(2) *Hemihyalea labecula* Grote, Plate XIV, Fig. 7, ♂.
(The Freckled Glassy-wing.)

This insect is not uncommon in Colorado. It occurs in early summer about Manitou, and among the mountains generally.

**Genus OPHARUS** Walker

An extensive neotropical genus, represented within the limits of the United States by but one species.

(1) *Opharus astur* Cramer, Plate XIV, Fig. 5, ♂. (The Astur Moth.)

*Syn. albicans*, Walker; *maculicollis* Walker; *pustulata* Packard.

The insect is common in Mexico and South America, and occasionally occurs in Arizona.

**Genus CALIDOTA** Dyar

A neotropical genus containing a dozen species or more, two of which are found within our limits. We figure one of these; the other, *C. muricompesor* Dyar, has the wings mouse-gray, semihyaline, the secondaries paler than the primaries. The head is gray in front, yellowish above; the thorax is gray, the collar edged inwardly with ochreous; the abdomen is reddish buff, with a series of black dorsal spots and broad lateral bands of the same color. The pectus and coxae are ochreous, the legs gray. The type of the species came from Arizona.

(1) *Calidota strigosa* Walker, Plate XVI, Fig. 24, ♂.
(The Streaked Calidota.)

*Syn. cubensis* Grote; *laqueata* Henry Edwards.

This insect occurs in Florida, and is abundant in the Antilles. Its life-history has been described by Dyar in the Proceedings of the United States National Museum, for 1900. p. 268. The food-plant is *Gnettarda elliptica*.

**Genus EUPSEUDOSOMA** Grote

Three species are attributed by Hampson to this genus, one of which, the type of the genus, we figure. It is the only species of the genus occurring within our territory.

(1) *Eupseudosoma involutum* Sepp, Plate XIV, Fig. 1, ♂.
(The Snowy Eupseudosoma.)

*Syn. nivea* Herrich-Schaeffer; *floridum* Grote; *immaculata* Graef.

139
The life-history of this species has been given by Dyar, *l. c.*, p. 258. The food-plants are *Eugenia buxifolia*, *Eugenia procera*, and *Psidium pyrifera*. The insect has a wide range in tropical America, occurring from Florida to southern Brazil.

**Genus BERTHOLDIA Schaus**

A small neotropical genus represented in our fauna by one species.

(1) *Bertholdia trigona* Grote, Plate XIV, Fig. 2, $$. (Grote's Bertholdia.)

The moth flies in Colorado, New Mexico, Arizona, and northern Mexico.

**FAMILY AGARISTIDÆ**

"Ye lovers of marvel and fairy lore,
Say not that the days of enchantment are o'er,
That the well-springs of Fancy and Fable fail.

There are streamlets yet where the river-sprite
With his Harlequin changes bewilders the sight;
There are castles yet of ivory and gold,
Hung with floral fabrics by sunshine unroll'd,
Within whose luxurious recesses recline
Fays of exquisite form, quaffing exquisite wine;
Some in gossamer veiled of ethereal dyes,
Which have only their match in the rainbow'd skies;
Some in richest and softest of velvets arrayed,
Or in mail that does shame to the armourer's trade.
These are haunting us ever for ill, or for good,
Through earth and through air, field, forest, and flood:
To transport our thoughts, as by magic spell,
From the sordid objects whereon they dwell,
To a land of the Marvellous dimly displayed,
Where the light-winged Fancy, by wonder stayed,
Still delighteth to hover, and joyously say:
'Oh! my darling elves, ye're not chased away,
There's a region still where ye have a place—
The mysterious world of the Insect race.'"

*Acheta Domestica*. *Episodes of Insect Life.*

The Agaristidae compose a family of moderate size. The moths are day-flying in their habit, and in the tropics both
Explanation of Plate XVII

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Haploa militaris Harris, ♀.

31. Panthea furcilla Packard, ♂, U. S. N. M.
32. Feralia jocos a Guenée, ♂.
of the Old World and the New reckon in their number some of the most resplendently colored insects found upon the globe. They are regarded as being an offshoot of the Noctuidae.

The following description of the characteristics of the family is adapted from Hampson with reference to the forms found within our faunal limits:

'Proboscis fully developed; palpi upturned and well developed, the third joint usually naked and porrect; frons with a rounded, conical, or corneous process; antennae cylindrical, almost simple, with slight bristles at the joints, not ciliated, and more or less distinctly dilated toward the extremity. Ocelli present; eyes sometimes hairy; tibial spurs well developed, the tibiae rarely spined; the male claspers often very large; wings large and strongly formed. Fore wing with vein 1a separate from 1b; 1c absent; 5 from or from close to angle of cell; the areole present in nearly all the genera. Hind wing with vein 1a present; 1c absent; 5 obsolescent from angle of discocellulars; 6, 7 from upper angle or shortly stalked; 8 free at base, then bent downward to anastomose with the cell at a point only. All the species have silvery blue scales on the fore wings.

The larvae are noctuiform and have all the prolegs present. The pupa is naked.'

Genus COPIDRYAS Grote

Two species belonging to this genus occur within the limits of the United States. We give illustrations of both of them.

(1) Copidryas gloveri Grote & Robinson, Plate XVII, Fig. 11, 6. (Glover’s Purslane-moth.)

The life-history of this rather pretty moth has been well worked out by Professor C. V. Riley and from his article published in "Insect Life," Vol. I, p. 104, we have taken the cuts which are here-with given. The drawings of the egg, pupa, and cocoon were made by Mr. C. L. Marlatt. The excellent account given by Professor Riley is drawn upon for the following quotations: "The eggs are laid

141
on the underside of the purslane leaf, either singly or in clusters from two to five. The larva hatches in two or three days, and is at first light green or yellowish green with darker shading across the middle of the body. In eight or nine days it attains full growth after having passed through four molts. The full grown larva is light gray or dull white with black dashes on the sides of each segment, and with the shadings of salmon pink."

"The full-grown larvae enter the ground for pupation, excavating a tubular burrow in the surface soil, gumming the lining and closing the opening with a thin layer of particles of soil. . . . The insect remains in this state in the neighborhood of twelve days."

In the accompanying figures we show the egg, the pupa, and the adult larva and moth. The insect is very abundant at certain times in Nebraska, Kansas, and the southwestern States generally, and ranges into northern Mexico. It appears to feed exclusively upon purslane, and as this plant is of no particular economic value, but is justly accounted as a troublesome weed, we may wish blessings upon Copidrys gloveri.

(2) Copidryas cosyra Druce, Plate XI, Fig. 19, c. (The Cosyra Moth.)

This pretty insect, which belongs to the same genus as the preceding, though assigned by the author of the species to the genus Euthisanotia, is found in Arizona and in Mexico. Its habits are undoubtedly very much
the same as those of Glover's Purslane Moth, though up to the present time no one has described them.

**Genus TUERTA Walker**

Only one species of this genus, which is better represented in Africa than in America, is found within our borders. (1) *Tuerta sabulosa* Boisduval. (The Sand-dune Moth.)

Genus TUERTA Walker

Only one species of this genus, which is better represented in Africa than in America, is found within our borders. (1) *Tuerta sabulosa* Boisduval. (The Sand-dune Moth.)

**Genus ALYPIA Hübner**

This genus is well represented within our territory. The following synopsis of the species is adapted from Hampson:

I. (*Androloma.*) Fore wing of male with a dilation of costa and a groove of ribbed membrane below it from base extending beyond middle. .................. *mac-cullochi*

II. Fore wing of male with a postmedial dilation of costa and groove of ribbed membrane below it; wing elongated.

a. Fore wing with the markings yellow .................. *disparata*
   b. Fore wing with the markings white .................. *brannani*

III. (*Alypia.*) Fore wing of male without dilation of costal area or groove.

A. Fore and mid tibie, orange; hind wings marked with white.
   a. Discal spot of fore wing longitudinal .................. *octomaculata*
   b. Discal spot of fore wing transverse .................. *wittfeldi*
   Hind wings marked with yellow.
   c. Hind wing with subbasal yellow spot .................. *dipsaci*
   d. Hind wing without subbasal yellow spot .................. *langtoni*

B. Mid tibie only orange.
   a. Wings with the spots not traversed by black veins . *mariposa*
   b. Wings with the spots traversed by black veins ........ *ridingsi* (1) *Alypia mac-cullochi* Kirby, Plate XVII, Fig. 13, 5. (MacCulloch's Forester.)

Syn. *lorquini* Grote & Robinson; *similis* Stretch; *edwardsi* Boisduval.

The habitat of this species is Canada and the Rocky Mountains northward to Alaska.
Agaristidæ

(2) Alypia disparata Henry Edwards. (The Mexican Forester.)

Syn. gracilenta Graef; desperata Kirby.

The structural features of this species are shown in the accompanying cut, for the use of which we are indebted to the kindness of Sir George F. Hampson. The insect occurs in southern Texas, Arizona, and Mexico. The writer has a large series collected for him in the neighborhood of Jalapa, where it is apparently more common than farther north.

(3) Alypia octomaculata Fabricius, Plate XVII, Figs. 16, 20, ęż., Fig. 21, ę. (The Eight-spotted Forester.)

Syn. bimaculata Gmelin; quadriguttalis Hübner; matuta Henry Edwards.

This very common insect, which sometimes proves a veritable plague by the depredations which it commits upon the foliage of the Ampelopsis, which is extensively grown in our cities as a decorative vine, is found everywhere in the northern Atlantic States, and ranges westward beyond the Mississippi. One good thing which can be set down to the English sparrow is the work, which he has been observed by the writer to do in devouring the larvae of this moth from the vines with which his home is covered.

(4) Alypia wittfeldi Henry Edwards, Plate XVII, Fig. 18, ęż., Fig. 19, ę. (Wittfeld’s Forester.)

Sir George F. Hampson sinks this species as a synonym of A. octomaculata, but the writer cannot agree with him in this. The form of the spots on the primaries, the white at the
Agaristidae

base of the abdomen, and the white annulus near its extremity, are at all events marks quite as characteristic as those by which some other species in the genus are separated. Its habitat is southern Florida.

(5) Alypia langtoni Couper, Plate XVII, Fig. 17, q. (Langton’s Forester).

Syn. sacramenti Grote & Robinson; hudsonica Henry Edwards.

This species ranges from Canada westward through British Columbia into California in the south and Alaska in the north.

(6) Alypia mariposa Grote & Robinson, Plate XVIII, Fig. 15. (The Californian Forester.)

This, undoubtedly the handsomest species of the genus, is confined to the Pacific coast.

(7) Alypia ridingsi Grote, Plate XVII, Fig. 13, 8., Fig. 14, q. (Ridings’ Forester.)

A common species in the Rocky Mountain region at high elevations, and ranging northward to Sitka and the valley of the Yukon.

Genus ALYPIODES Grote

Two species of this genus are Mexican, the third is found in our fauna, though also occurring south of our boundary.

(1) Alypiodes bimaculata Herrich-Schaeffer, Plate XVII, Fig. 22. (The Two-spotted Forester)

Syn. trimaculata Boisduval.

The figure in the plate represents the typical form, the figure in the cut shows the aberration named crescent by Walker, in which the hind wing has a yellow spot about the middle of the wing. The insect is fairly common in southern California, New Mexico, and Arizona.

"The entomologist need not relax his endeavors day or night. Moth- ing is night employment."—A. S. Packard.

145
SUGARING FOR MOTHS

The day has been hot and sultry. The sun has set behind great banks of clouds which are piling up on the northwestern horizon. Now that the light is beginning to fade, the great masses of cumulus, which are slowly gathering and rising higher toward the zenith, are lit up by pale flashes of sheet-lightning. As yet the storm is too far off to permit us to hear the boom of the thunder, but about ten or eleven o'clock to-night we shall probably experience all the splendor of a dashing thunder-shower.

Along the fringe of woodland which skirts the back pastures is a path which we long have known. Here stand long ranks of ancient beeches; sugar maples, which in fall are glorious in robes of yellow and scarlet; ash trees, the tall gray trunks of which carry skyward huge masses of light pinnated foliage; walnuts and butternuts, oaks, and tulip-poplars. On either side of the path in luxuriant profusion are saplings, sprung from the monarchs of the forest, young elm trees planted by the winds, broad-leaved papaws, round-topped hawthorns, viburnums, spreading dogwoods, and here and there in moist places clumps of willows. Where the path runs down by the creek, sycamores spread their gaunt white branches toward the sky, and drink moisture from the shallow reaches of the stream, in which duckweed, arrow-weed, and sweet pond-lilies bloom.

The woodland is the haunt of many a joyous thing, which frequents the glades and hovers over the flowers. To-night the lightning in the air, the suggestion of a coming storm which lurks in the atmosphere, will send a thrill through all the swarms, which have been hidden through the day on moss-grown trunks, or among the leaves, and they will rise, as the dusk gathers, in troops about the pathway. It is just the night upon which to take a collecting trip, resorting to the well-known method of "sugaring."

Here we have a bucket and a clean whitewash brush. We
have put into the bucket four pounds of cheap sugar. Now we
will pour in a bottle of stale beer and a little rum. We have
stirred the mixture well. In our pockets are our cyanide jars.
Here are the dark lanterns. Before the darkness falls, while yet
there is light enough to see our way along the path, we will pass
from tree to tree and apply the brush charged with the sweet
semi-intoxicating mixture to the trunks of the trees.

The task is accomplished! Forty trees and ten stumps have
been baptized with sugar-sweetened beer. Let us wash our
sticky fingers in the brook and dry them with our handkerchiefs.
Let us sit down on the grass beneath this tree and puff a good
Havana. It is growing darker. The bats are circling overhead.
A screech-owl is uttering a plaintive lament, perhaps mourning
the absence of the moon, which to-night will not appear. The
frogs are croaking in the pond. The fireflies soar upward and
flash in sparkling multitudes where the grass grows rank near
the water.

Now let us light our lamps and put a drop or two of chloro-
form into our cyanide jars, just enough to slightly dampen the
paper which holds the lumps of cyanide in place. We will
retrace our steps along the path and visit each moistened spot
upon the tree-trunks.

Here is the last tree which we sugared. There in the light
of the lantern we see the shining drops of our mixture clinging
to the mosses and slowly trickling downward toward the
ground. Turn the light of the lantern full upon the spot,
advancing cautiously, so as not to break the dry twigs under
foot or rustle the leaves. Ha! Thus far nothing but the black
ants which tenant the hollows of the gnarled old tree appear
to have recognized the offering which we have made. But
they are regaling themselves in swarms about the spot. Look
at them! Scores of them, hundreds of them are congregat-
ing about the place, and seem to be drinking with as much
enjoyment as a company of Germans on a picnic in the
wilds of Hoboken.

Let us stealthily approach the next tree. It is a beech.
What is there? Oho! my beauty! Just above the moistened
patch upon the bark is a great Catocala. The gray upper wings
are spread, revealing the lower wings gloriously banded with
Sugaring for Moths

black and crimson. In the yellow light of the lantern the wings appear even more brilliant than they do in sunlight. How the eyes glow like spots of fire! The moth is wary. He has just alighted; he has not yet drunk deep. Move cautiously! Keep the light of the lantern steadily upon him. Uncover your poisoning jar. Approach. Hold the jar just a little under the moth, for he will drop downward on the first rush to get away. Clap the jar over him! There! you have done it! You have him securely. He flutters for a moment, but the chloroform acts quickly and the flutterings cease. Put that jar into one pocket and take out another. Now let us go to the next tree. It is an old walnut. The trunk is rough, seamed, and full of knotted excrescences. See what a company has gathered! There are a dozen moths, large and small, busily at work tippling. Begin with those which are nearest to the ground. When I was young my grandfather taught me that in shooting wild turkeys resting in a tree, it is always best to shoot the lowest fowl first, and then the next. If you shoot the gobbler which perches highest, as he comes tumbling down through the flock, he will startle them all, and they will fly away together; but if you take those which are roosting well down among the branches, those above will simply raise their heads and stare about for a moment to find out the source of their peril, and you can bag three or four before the rest make up their minds to fly. I follow the same plan with my moths, unless, perchance, the topmost moth is some unusual rarity, worth all that suck the sweets below him.

Bravo! You have learned the lesson well. You succeeded admirably in bottling those *Taraches* which were sucking the moisture at the lower edge of the sweetened patch. There above them is a fine specimen of *Stenoloma lunilinea*. Aha! You have him. Now take that *Catocala*. It is *amasia*, a charming little species. Above him is a specimen of *cara*, one of the largest and most superb of the genus. Well done! You have him, too. Now wait a moment! Have your captives ceased their struggles in your jar? Yes; they seem to be thoroughly stunned. Transfer them to the other jar for the cyanide to do its work. Look at your lantern. Is the wick trimmed? Come on then.

Let us go to the next tree. This is an ash. The moist spot
Sugaring for Moths

shows faintly upon the silvery-gray bark of the tree. Look sharply! Here below are a few Geometers daintily sipping the sweets. There is a little Eustixis pupula, with its silvery-white wings dotted with points of black. There is a specimen of Harrisimemna, the one with the coppery-brown spots on the fore wings. A good catch!

Stop! Hold still! Ha! I thought he would alight. That is Catocala coccinata—a fine moth—not overly common, and the specimen is perfect.

Well, let us try another tree. Here they are holding a general assembly. Look! See them fairly swarming about the spot. A dozen have found good places; two or three are fluttering about trying to alight. The ants have found the place as well as the moths. They are squabbling with each other. The moths do not like the ants. I do not blame them. I would not care to sit down at a banquet and have ants crawling all over the repast. There is a specimen of Catocala relicta, the hind wings white, banded with black. How beautiful simple colors are when set in sharp contrast and arranged in graceful lines! There is a specimen of Catocala neogama, which was originally described by Abbot from Georgia. It is not uncommon. There is a good Mamestra, and there Pyrophila pyramidoides. The latter is a common species; we shall find scores of them before we get through. Do not bother with those specimens of Agrotis Ypsilon; there are choicer things to be had. It is a waste of time to take them to-night. Let them drink themselves drunk, when the flying squirrels will come and catch them. Do you see that flying squirrel there peeping around the trunk of the tree? Flying squirrels eat insects. I have seen them do it at night, and they have robbed me of many a fine specimen.

Off now to the next tree!

And so we go from tree to tree. The lightning in the west grows more vivid. Hark! I hear the thunder. It is half-past nine. The storm will be here by ten. The leaves are beginning to rustle in the tree-tops. The first pulse of the tornado is beginning to be felt. Now the wind is rising. Boom! Boom! The storm is drawing nearer. We are on our second round and are coming up the path near the pasture-gate. Our
Sugaring for Moths

collecting jars are full. We have taken more than a hundred specimens representing thirty species. Not a bad night's work. Hurry up! Here are the draw-bars. Are you through? Put out the light in your lantern. Come quickly after me. I know the path. Here is the back garden gate. It is beginning to rain. We shall have to run if we wish to avoid a wetting. Ah! here are the steps of the veranda. Come up!

My! what a flash and a crash that was! Look back and see how the big trees are bowing their heads as the wind reaches them, and the lightning silhouettes them against the gray veil of the rain. We may be glad we are out of the storm, with a good roof overhead. To-morrow morning the sun will rise bright and clear, and we shall have work enough to fill all the morning hours in setting the captures we have made. Good-night!

"It is interesting to contemplate a tangled bank, clothed with many plants of many kinds, with birds singing on the bushes, with various insects flitting about, and with worms crawling through the damp earth, and to reflect that these elaborately constructed forms, so different from each other, and dependent upon each other in so complex a manner, have all been produced by laws acting around us. These laws, taken in the largest sense, being Growth with Reproduction; Inheritance, which is almost implied by reproduction; Variability, from the indirect and direct action of the conditions of life, and from use and disuse; a Ratio of Increase so high as to lead to a Struggle for Life, and as a consequence to Natural Selection, entailing Divergence of Character and the Extinction of less improved forms. Thus, from the war of Nature, from famine and death, the most exalted object which we are capable of conceiving, namely, the production of the higher animals, directly follows: There is a grandeur in this view of life, with its several powers, having been originally breathed by the Creator into a few forms or into one, and that, whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and most wonderful have been and are being evolved."—Darwin.
FAMILY NOCTUIDÆ

"Shall mortal man be more just than God?
Shall a man be more pure than his Maker?
Behold He put no trust in His servants;
And His angels He charged with folly:
How much less in them that dwell in houses of clay,
Whose foundation is in the dust,
Which are crushed before the moth?"

Job, Chapter IV, 17–19.

The Noctuidæ are a huge complex of genera and species, the genera being reckoned by hundreds, and the species by thousands. Within the faunal limits intended to be covered by this book there are already known to occur in the neighborhood of three hundred and seventy-five genera, and many more than two thousand species which are referable to this family. In the arrangement of the genera and the species the author has in the main followed Dyar's Catalogue, which is based upon that of Prof. J. B. Smith, published in 1893 as "Bulletin 44 of the United States National Museum."

The moths are nocturnal in their habits. The neuration is very constant, and is described as follows by Hampson ("Moths of India," Vol. II, p. 160):

"Fore wing with vein 1a slight and not anastomosing with 1b; 1c absent; 2 from middle of cell; 3, 4, 5 from close to lower angle; 6 from upper angle; 8 given off from 7 and anastomosing with 9, which is given off from 10 to form an areole; 11 from cell; 12 long. Hind wing with 1a and b present; 1c absent; 2 from middle of cell; 3 and 4 from lower angle; 5 from near lower angle or middle of discocellulars, rarely absent, but more or less aborted in the Acontinae and Trifinae. Frenulum always, proboscis almost always, present."

The larvae are generally naked, or at most pubescent. In some of the subfamilies the larvae are semiloopers, some of the prolegs being absent. Pupation generally takes place under
Noctuidae
ground without a cocoon, the earth being fashioned in some
cases into a cemented cell about the pupa.

Genus PANTHEA Hübner

(1) Panthea furcilla Packard, Plate XVII, Fig. 31, ♂.
(The Eastern Panthea.)
Closely allied to the following species, from which it may be
distinguished by the absence of the reniform spot at the end of
the cell.

(2) Panthea portlandia Grote, Plate XVII, Fig. 30, ♂.
(The Western Panthea.)
Transverse markings less diffuse than in the preceding
species, and reniform spot always present.

P. furcilla occurs on the northern Atlantic, and P. portlandia
on the northern Pacific coast.
(For the other two species consult Proceedings U. S. Nat. Museum,
Vol. XXI, p. 13.)

Genus DEMAS Stephens

(1) Demas propinquilinea Grote, Plate XIX, Fig. 3, ♀.
(The Close-banded Demas.)
The caterpillar feeds on various deciduous trees, making a
case for itself by drawing two leaves together with strands of
silk. It occurs in the Atlantic States.
(For the other two species of genus see Proceedings U. S. Nat. Museum,
Vol. XXI, p. 22.)

Genus CHARADRA Walker

(1) Charadra deridens Guenée, Plate XVIII, Fig. 4, ♀.
(The Laugher.)
Syn. circumfer Walker; contigua Walker.
A rather rare moth, the habitat of which is the Atlantic States,
and the larva of which makes a case for itself, very much as
done by the preceding species.

(2) Charadra illudens Walker, Plate XVIII, Fig. 5, ♂,
Fig. 2, ♀.
(The Sport.)
Syn. python Druce.
A Mexican species, which I admit to the fauna of our territory
on the authority of George Franck of Brooklyn, who reports its
occurrence in Florida.
(3) Charadra decora Morrison, Plate XVII, Fig. 29, ♂.
(The Dandy.)

Syn. felina Druce.

This is likewise a Mexican species, which is said to occur in Arizona, but the fact of its being found there requires verification.

One other species of the genus, C. dispulsa Morrison, occurs in the Southern States.

Genus RAPHIA Hübner

(1) Raphia frater Grote, Plate XVIII, Fig. 3, ♀.
(The Brother.)

Syn. personata Walker; flexuosa Walker.

There are three species belonging to this genus in our fauna. They are closely alike in appearance. The species we figure occurs in the Eastern States. *R. abrupta* Grote is also an eastern species, while *R. coloradensis* is found in the West.

Genus APATELA Hübner

This is a large genus, well represented in the temperate regions of both the Old World and the New. The latest Catalogue of the Lepidoptera of the United States credits our fauna with seventy-five species. The genus has been monographed by Smith & Dyar. (See Proceedings U. S. Nat. Museum, Vol. XXI, pp. 1-104.) Within the compass of these pages we cannot do more than give a representation of a number of the forms, which have been described, leaving the student to further researches in the readily accessible literature of the subject.

(1) Apatela americana Harris, Plate XVIII, Fig. 12, ♀.
(The American Dagger-moth.)

Syn. acericola Guenée; obscura Henry Edwards; acris Abbot & Smith (non Linnaeus).

This is one of the largest species of the genus.

The caterpillar feeds upon deciduous trees of many genera, and the insect occurs from New England to Utah and south to the Gulf States.

(2) Apatela dactylina Grote, Plate XVIII, Fig. 17, ♂.
(The Fingered Dagger-moth).

Easily distinguished from the preceding species, which it
Noctuidae

resembles in the markings of the fore wings, by its smaller size and the white hind wings. It ranges from Canada to Virginia and westward to the Rocky Mountains. The caterpillar lives upon alder, willow, and birch.

(3) Apatela populi Riley, Plate XVIII, Fig. 14, ♀ (The Cottonwood Dagger-moth.)

The moth, of which we reproduce the figures of the larva and imago given by Professor Riley, who first described the species, ranges from Canada to the western parts of the Carolinas, thence across the continent to the Pacific coast, avoiding the warmer regions of the Gulf States and southern California. The imago is discriminated from Apatela lepusculina Guenée by the broader wings, especially of the female, by the paler ground-color of the primaries, and by the absence of the orbicular spot, which is very rarely as conspicuous as it appears in the figure given by Riley, and still further by the very short basal dash on the fore wings, which in A. lepusculina is long, reaching outwardly as a sharply defined black line one-third of the length of the cell. The larva is also quite different in important particulars from that of the species, which has been named, but with which this species is often confounded in collections. The caterpillar feeds upon the foliage of different species of the genus Populus, and is particularly common in the
States of the Mississippi Basin upon the Cottonwood (Populus monilifera and Populus heterophylla.)

(4) Apatela innotata Guenée, Plate XVIII, Fig. 13, ♂.
(The Unmarked Dagger-moth.)
Syn. grafi Grote.

The figure given in the plate represents a form intermediate between those depicted by Smith & Dyar. (See Proceedings U. S. Nat. Museum, Vol. XXI, Plate II, Figs. 17, 18). The ground color is a dirty yellowish-white. The species occurs in Canada and the northern Atlantic States.

(5) Apatela morula Grote, Plate XVIII, Fig. 8, ♀.
(The Darkish Dagger-moth.)
Syn. ulmi Harris.

This insect occurs from Canada southward and westward to the Rocky Mountains. The caterpillar feeds upon elm, apple, and linden.

(6) Apatela interrupta Guenée, Plate XIX, Fig. 5, ♀.
(The Interrupted Dagger-moth.)
Syn. occidentalis Grote & Robinson.

The larva feeds upon the Rosaceæ, and also upon the elm and the birch. The insect has a wide range from the Atlantic seaboard to the Rocky Mountains and from Canada to the northern portions of the Gulf States.

(7) Apatela lobeliae Guenée, Plate XVIII, Fig. 9, ♂.
(The Lobelia Dagger-moth.)

The caterpillar feeds upon oak, in spite of the fact that the author of the species attributed it to the Lobelia, which would no doubt poison it if administered. It ranges from Canada to Florida and Texas, and westward to the Rocky Mountains.

(8) Apatela furcifera Guenée, Plate XVIII, Fig. 10, ♂.
(The Forked Dagger-moth.)

The range of this species is practically the same as that of the preceding. The larva feeds upon various species of wild-cherry.

(9) Apatela haste Guenée, Plate XIX, Fig. 6, ♀.
(The Dart Dagger-moth.)
Syn. telum Guenée.

The insect is found in the northern Atlantic States and Canada. It is smaller and darker than the preceding species, to
which it is closely allied. The figure in the plate is hardly
dark enough.

(10) Apatela quadrata Grote, Plate XVIII, Fig. 15, ♀.
(The Quadrate Dagger.)
This species occurs on the Pacific coast and ranges eastward
as far as Alberta in the north and Kansas in the south. The
author does not recall a description of the larva.

(11) Apatela superans Guenee, Plate XVIII, Fig. 26, ♀.
(The Chieftain Dagger.)
This is a well-marked species, which cannot easily be mis-
taken. It occurs in Canada, southward to the Carolinas, and
westward through the valley of the Mississippi. The larva feeds on
the same plants as its allies, which have been mentioned above.

(12) Apatela lithospila Grote, Plate XVIII, Fig. 24, ♂.
(The Streaked Dagger.)
Ranges from the Atlantic to the Pacific. The larva feeds
upon oak, hickory, and chestnut.

(13) Apatela connecta Grote, Plate XVIII, Fig. 19, ♂.
(The Connected Dagger.)
The habitat of this species is found from Canada to the
Carolinas and westward to the Mississippi. The larva feeds on
willows.

(14) Apatela fragilis Guenee, Plate XIX, Fig. 1, ♂. (The
Fragile Dagger-moth.)
Syn. spectans Walker.
This delicate little species has by some authors been referred
to the genus Microcelia, but is a true Apatela. It ranges from
Canada to the Carolinas and westward to the Mississippi. The
caterpillar feeds on birch and various plants belonging to the
Rosaceae.

(15) Apatela vinnula Grote, Plate XVIII, Fig. 25, ♀.
(The Delightful Dagger.)
This pretty and easily recognizable species feeds in the
larval stage upon the elm and ranges from the Atlantic coast
to the border of the Great Plains. It comes very freely to sugar.

(16) Apatela grisea Walker, Plate XVIII, Fig. 11, ♀.
(The Gray Dagger-moth.)
Syn. pudorata Morrison.
The caterpillar feeds on apple, birch, willow, elm, and arrow
MUSIC IN CHURCH

THE QUESTIONS OF PRACTICAL CHURCH MUSIC.

CHAPTER II.

The Constitution of the Church.

The Church is constituted by the Nicene Creed and the Apostles' Creed.

The Nicene Creed is the confession of the Christian Church.

The Apostles' Creed is the confession of the Christian Church.

The Church is divided into three parts:

1. The Church Universal.
2. The Church of the West.
3. The Church of the East.

The Church Universal is divided into three parts:

1. The Church of the East.
2. The Church of the West.
3. The Church of the South.

The Church of the West is divided into three parts:

1. The Church of England.
2. The Church of Scotland.
3. The Church of Ireland.

The Church of the East is divided into three parts:

1. The Church of the East.
2. The Church of the West.
3. The Church of the South.

The Church of the South is divided into three parts:

1. The Church of the East.
2. The Church of the West.
3. The Church of the South.
EXPLANATION OF PLATE XVIII

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Dipithera fallax Herrich-Schaeffer, ♀.
2. Charadra illudens Walker, ♀.
3. Raphia frater Grote, ♀, U. S. N. M.
5. Charadra illudens Walker, ♂.
6. Arsilonche albovenosa Geeze, ♂.
7. Merolonche lupini Grote, ♀,
   Merrick Collection.
8. Apatela morula Grote, ♂.
10. Apatela furciíera Guenée, ♂.
12. Apatela americana Harris, ♀.
15. Apatela quadrata Grote, ♀.
16. Apatela radcliffae Harvey, ♂.
17. Apatela dactylina Grote, ♂.
18. Apatela oblinita Abbot & Smith, ♀.
19. Apatela connecta Grote, ♂.
20. Apatela noctivaga Grote, ♀.
22. Apatela impleta Walker, ♀.
23. Apatela brumosa Guenée, ♂.
24. Apatela xyiniformis Guenée, ♂,
   Merrick Collection.
25. Apatela vinnula Grote, ♀.
wood (*Euonymus*). The insect is found from Canada to Georgia and westward to Missouri and Minnesota.

(17) **Apatela albarufa** Grote, Plate XVIII, Fig. 16, ♂.
(The Reddish-white Dagger.)

A somewhat variable species characterized by a very faint reddish cast upon the primaries. It ranges from the Atlantic to New Mexico and Colorado.

(18) **Apatela brumosa** Guenée, Plate XVIII, Fig. 23, ♂.
(The Frosty Dagger-moth.)

Syn. *inclara* Smith.

Very closely allied to *A. impressa* Walker, but easily distinguished from that species by the lighter hind wings. The larva feeds upon willow, birch, and alder.

(19) **Apatela noctivaga** Grote, Plate XVIII, Fig. 20, ♀.
(The Burglar Dagger.)

The larva feeds upon poplar and various herbaceous plants. The insect is found over almost the entire United States and southern Canada.

(20) **Apatela impressa** Walker, Plate XVIII, Fig. 21, ♂.
(The Printed Dagger.)

The larva feeds upon willow, plum, hazel, currant, and blackberry. It is found from the Atlantic coast to the Rocky Mountains.

(21) **Apatela impleta** Walker, Plate XVIII, Fig. 22, ♀.
(The Yellow-haired Dagger.)

Syn. *luteicoma* Grote.

The range of this species is from Canada to Florida and westward far into the valley of the Mississippi. The larva feeds on a great variety of deciduous trees and shrubs.

(22) **Apatela oblinita** Abbot & Smith, Plate XVIII, Fig. 18, ♀. (The Smeared Dagger.)

Syn. *salicis* Harris.

This is probably the commonest species of the genus. It occurs from eastern Canada to Florida and westward to the Rocky Mountains. The larva feeds on a great variety of shrubs and herbaceous plants. It never is found upon trees. It is very fond of the various species of smart-weed (*Polygonum*), and in the
Noctuidæ

fall of the year it is very abundant in places where this plant grows. It does some damage to cotton-plants in the South, but by hand-picking it can easily be kept under. The cocoon, which is composed of yellowish silk, is long and oval. There are two broods in the Middle States. The hibernating insects emerge from their cocoons in May, and lay their eggs. The caterpillars develop and the second brood of moths appears upon the wing in July. They oviposit and the caterpillars of this generation, having made their cocoons, pass the winter in the pupal state.

Genus APHARETRA Grote

This is a small genus, the species of which have been separated from Apatela, in which they have been formerly placed. We give figures of both species known to occur within our territory. They have been drawn from the types, and will suffice for the identification of the perfect insects. Nothing is as yet known as to their larval stages.

(1) Apharetra dentata Grote. (The Toothed Apharetra.)
This insect occurs in Canada and the northern portions of New York and New England. It is, however, for some reason as yet very rare in collections. The annexed cut has been
Noctuidae

drawn for me by Mr. Horace Knight from the type which is contained in the British Museum.

(2) *Apharetra pyralis* Smith. (Smith's *Apharetra*.)

The specimen represented in Fig. 89 is the type contained in the United States National Museum, a drawing of which I was kindly permitted to make. The species is considerably darker than the preceding. It is thus far only known from the Territory of Alberta in British America.

**Genus ARSILONCHE Lederer**

Two species belonging to this genus are represented in our fauna. *Arsilonche colorada* was described by Smith in the Proceedings of the United States National Museum, Vol. XXII, p. 414, in 1900. The other species, which is well known, we figure.

(1) *Arsilonche albovenosa* Goeze, Plate XVIII, Fig. 6, ♂. (The White-veined Dagger.)

The abdomen in our figure is dark, the specimen being greased. It should be light, like the thorax. The insect occurs quite commonly in Canada and the northern portions of the United States, and also in Europe and northern Asia.

**Genus MEROLONCHE Grote**

For a full account of the three species contained in this genus the student is referred to the Proceedings of the United States National Museum, Vol. XXI, p. 179.

(1) *Merolonche lupini* Grote, Plate XVIII, Fig. 7, ♂. (The Lupine Dagger.)

Like all the species of this genus the Lupine Dagger is an inhabitant of the Pacific States. Good specimens are rare in collections.

**Genus HARRISIMEMNA Grote**

Only one species of this genus is thus far known.

(1) *Harrisimemna trisignata* Walker, Plate XIX, Fig. 4, ♀. (Harris's Three-spot.)
Noctuidae

The moth ranges from Canada to Texas, and from the Atlantic to the Great Plains. The larva feeds on the winterberry and the lilac.

Genus MICROCEelia Guenée

This genus is like the preceding represented in our territory by but one species.

(1) Microccelia diphtheroides Guenée, Plate XIX, Fig. 9, δ; form obliterata Grote, Plate XIX, Fig. 10, δ. (The Marbled Microccelia.)

The form obliterata in which the marblings are wanting is common. The species is found in the Atlantic Subregion of the United States.

Genus JASPIDIA Hübner

This is a moderately large genus embracing five species, which occur in our fauna. We figure two of them.

(1) Jaspidia lepidula Grote, Plate XIX, Fig. 7, δ. (The Marbled-green Jaspidia.)

This is a common species in the Atlantic Subregion, ranging from Canada to the Carolinas and westward to the Mississippi.

(2) Jaspidia teratophora Herrich-Schaeffer, Plate XIX, Fig. 8, δ. (The White-spotted Jaspidia.)

The distribution of this species is practically the same as that of the preceding.

Genus DIPHTHERA Hübner

There is but one species of this genus in our fauna.

(1) Diphthera fallax Herrich-Schaeffer, Plate XVIII, Fig. 1, δ. (The Green Marvel.)

This beautiful little moth is not uncommon in the Appalachian, or Atlantic, Subregion of the Continent.

Genus POLYGRAMMATE Hübner

This genus like the preceding is represented in our territory by but a single species.

(1) Polygrammate hebraicum Hübner, Plate XIX, Fig. 11, δ. (The Hebrew.)

Syn. hebraea Guenée.
Noctuidae

The caterpillar feeds upon the sour gum-tree (*Nyssa sylvestrica*). The larval stages have been described by Dyar. (See Proceedings U. S. Nat. Museum, Vol. XXI, p. 9.) The insect is not uncommon in Pennsylvania and has much the same range as the preceding three or four species.

Genus CERMA Hübner

Three species of this genus are credited to our fauna. The one of which we give a cut has been by some authors confounded with *Polygrammate hebraicum*.

(1) Cerma cora Hübner. (The Cora Moth.)

*Syn. festa* Gueneé.

The ground-color of this pretty little moth is white shading into vinaceous gray, upon which the darker markings stand forth conspicuously. It is quite rare, and so far as is known is confined to the Atlantic Subregion of the continent. The figure was drawn by the author from a specimen in the possession of the Brooklyn Institute, belonging to the Neumægen Collection.

Genus CYATHISSA Grote

(1) Cyathissa percara Morrison, Plate XIX, Fig. 12, ♂

(The Darling Cyathissa.)

This pretty little species is found in the Gulf States and has been reported as ranging northward as far as Colorado. A second species of the genus has during the past year been described by Prof. J. B. Smith, from southern California, under the name *pallida*.

Genus CHYTONIX Grote

(1) Chytonix palliatricula Guenée, Plate XIX, Fig. 13, ♂

*Fig. 14, ♂, var.* (The Cloaked Marvel.)

*Syn. iaspis* Guenée.

A common species in the Northern Atlantic States. It may be found in June and July in Pennsylvania seated upon the bark of oak-trees in the forest. It comes freely to sugar and to light.
Genus COPIBRYOPHILA Smith

Of the sole species, named angelica, belonging to this genus, which was erected by Prof. J. B. Smith in the year 1900 (see “Proceedings U. S. Nat. Mus.,” Vol. XXII, p. 416), we give a cut made from a drawing of the type, which is contained in the National Museum at Washington.

Fig. 91.—Copibryophila angelica, ♀ ♂.

Genus ALEPTINA Dyar

This genus has been erected by Dyar to accommodate the species named inca by him in the “Canadian Entomologist,” Vol. XXXIV, p. 104. The male is figured on Plate XVII, Fig. 28. The insect is found in Arizona and Texas.

Genus BAILEYA Grote

A small genus, the species in which have been commonly referred hitherto to the genus *Leptina*, but erroneously.

(1) Baileya ophthalmica Guenée, Plate XVII, Fig. 25, ♀.

Not an uncommon species in the Appalachian Subregion. It comes freely to sugar, and is rather abundant in the forests of southern Indiana.

(2) Baileya australis Grote, Plate XVII, Fig. 27, ♂.

This is smaller than the preceding species, and generally lighter in color, with a very pronounced blackish apical shade on the fore wings. It occurs in the Gulf States from Florida to Texas.

(3) Baileya doubledayi Guenée, Plate XVII, Fig. 26, ♂.

Of the same size as *ophthalmica*, but differently marked. From *australis* it may readily be distinguished by its larger size, and by the different marking of the apex of the fore wings.

Genus HADENELLA Grote

(1) Hadenella pergentilis Grote, Plate XIX, Fig. 24, ♀.

This inconspicuous, but neatly marked little insect, belongs to the region of the Pacific coast, and ranges eastward as far as Colorado.

(2) Hadenella subjuncta Smith, Plate XIX, Fig. 25, ♂.
The identification of this insect with *minuscula* Morrison, made by Dr. Dyar, is open to question. The range of this species is from the Atlantic to the mountains of Colorado, north of the Gulf States.

**Genus ACOPA Harvey**

(1) *Acopa carina* Harvey, Plate XIX, Fig. 16, ♂.
The habitat of this species is Texas. Three other species belonging to the region of the Southwestern States have been referred to this genus.

**Genus CATABENA Walker**

(1) *Catabena lineolata* Walker, Plate XIX, Fig. 15, ♂.
Syn. *miscellus* Grote.
This is a common little moth which ranges from the Atlantic States to California. It is freely attracted to light. The larva feeds on *Verbena*.

**Genus CRAMBODES Guenée**

(1) *Crambodes talidiformis* Guenée, Plate XIX, Fig. 17, ♂.
A common species in the Appalachian Subregion, ranging westward as far as Colorado. Like the preceding species the larval form feeds on *Verbena*.

**Genus PLATYSENTA Grote**

(1) *Platysenta videns* Guenée, Plate XIX, Fig. 21, ♀.
Syn. *indigens* Walker; *meskei* Speyer; *atriciliata* Grote.
This species has the same range as the preceding. It is common at sugar.

(2) *Platysenta albipuncta* Smith, Plate XIX, Fig. 23, ♂.
This moth was originally described from Colorado, but it occurs all through the Southwestern States. The specimen figured came from Texas.

**Genus BALSA Walker**

(1) *Balsa malana* Fitch, Plate XIX, Fig. 18, ♂.
Noctuidæ

This is a very common species in the Atlantic States and is freely attracted to light.

Genus PLATYPERIGEA Smith

This genus has been erected by Prof. J. B. Smith for the reception of three species, two of which we figure in the annexed cuts, which have been made for me from the types through the courtesy of Dr. H. G. Dyar, of Washington. All of the species have been recorded from Colorado. They also occur in Wyoming, and I have specimens collected for me in the Freeze-out Mountains in that State. They probably have an extensive range in the Rocky Mountains.

Genus ANORTHODES Smith

(1) Anorthodes prima Smith, Plate XIX, Fig. 19, ♂.
This inconspicuous insect is quite common in central Ohio, and its range extends thence southward into the Southern States. It occurs in Kentucky, Tennessee, the Carolinas, and Georgia.

Genus CARADRINA Ochsenheimer

This is a genus of moderate extent, represented both in the Old World and the New. We have chosen a few species, familiarity with which will enable the student to recognize others.

(1) Caradrina meralis Morrison, Plate XIX, Fig. 22, ♂.
(The Mooned Rustic.)
Syn. bilunata Grote.
The moth is distributed from the Atlantic seaboard to the interior of New Mexico. It is common in Texas.

(2) Caradrina multifera Walker, Plate XIX, Fig. 29, ♀.
(The Speckled Rustic.)
Syn. fidicularia Morrison.
The habitat of this species is the Atlantic Subregion.
Explanation of Plate XIX

(Except when otherwise indicated, the specimens are contained in the collection of W. J. Holland.)

1. Apatela fragilis Guenee, ♀.
2. Ciris wilsoni Grote, ♀.
3. Demas propinquilinea Grote, ♀, U. S. N. M.
5. Apatela interrupta Guenee, ♀.
6. Apatela hasta Guenee, ♀.
10. Microcelia diphtheroides var. obliterata, Grote, ♀.
11. Polygrammate hebratum Hubner, ♀.
12. Cyathissa percarca Morrison, ♀, U. S. N. M.
13. Chytonix palliatricula Guenee, ♀.
16. Acopa carina Harvey, ♀, U. S. N. M.
17. Crambodes talidiformis Guenee, ♀.
19. Anorthodes prima Smith, ♀.
20. Orthodes vecors Guenee, ♀.
22. Caradrina meralis Morrison, ♀.
23. Platysenta albipuncta Smith, ♀.
24. Hadenella pergentilis Grote, ♀, U. S. N. M.
25. Hadenella subjuncta Smith, ♀.
27. Caradrina punctivena Smith, ♀.
29. Caradrina multifera Walker, ♀.
30. Perigea xanthioides Guenee, ♀.
31. Perigea vecors Guenee, ♀.
32. Oligia festivoides Guenee, ♀.
33. Oligia grata Hübner, ♀.
34. Oligia fuscimacula Grote, ♀.
35. Hillia algens Grote, ♀.
36. Hadena passer Guenee, ♀.
37. Hadena burgessi Morrison, ♀.
38. Hadena lateritia Hübner, ♀.
40. Hadena ducta Grote, ♀.
41. Manestra juncimacula Smith, ♀.
42. Hadena nigrior Smith, ♀.
43. Hadena verbascoides Guenee, ♀.
44. Hadena devastatrix Brace, ♀.
45. Hadena arctica Boisduval, ♀.
(3) Caradrina spilomela Walker, Plate XIX, Fig. 28, ♂.
(The Convivial Rustic.)
Syn. conviva Harvey.
This is a neotropical species found all over the hotter parts of North and South America, and ranging northward into Arizona and Texas.

(4) Caradrina extimia Walker, Plate XIX, Fig. 26, ♂.
(The Civil Rustic.)
Syn. civica Grote.
The moth occurs in Colorado and thence westward to the Pacific.

(5) Caradrina punctivena Smith, Plate XIX, Fig. 27, ♂.
(The Brown-streaked Rustic.)
The identity of this insect with C. rufostriga Packard has been suggested as probable. Its habitat is Colorado, among the mountains, and Labrador. It no doubt occurs at intermediate points at suitable elevations. It is evidently a strictly boreal form.

Genus PERIGEA Guenée

This is a rather extensive genus, well represented in the warmer parts of the New World, and also occurring in the Eastern Hemisphere. Twenty-four species are credited to our fauna in the latest catalogue. We figure two of the commoner species, which have a wide range.

(1) Perigea xanthioides Guenée, Plate XIX, Fig. 30, ♂.
(The Red Groundling.)
This is not a scarce species in the Appalachian Subregion. It is particularly abundant in southern Indiana and Kentucky, where I have obtained it in large numbers.

(2) Perigea vecors Guenée, Plate XIX, Fig. 31, ♀.
(The Dusky Groundling.)
The distribution of this species is very much the same as that of the preceding.

Genus OLIGIA Hübner

Nine species belonging to this genus are credited to our territory, of which number three are selected for illustration.

(1) Oligia festivoides Guenée, Plate XIX, Fig. 32, ♂.
(The Festive Midget.)
Syn. varia W.-H. r.
Noctuidæ

This is not an uncommon species in the Atlantic States.

(2) *Oligia fuscimacula* Grote, Plate XIX. Fig. 34, ♂. (The Brown-spotted Midget.)

A common species in the Gulf States.

(3) *Oligia grata* Hübnér, Plate XIX, Fig. 33, ♂. (The Grateful Midget.)

Syn. *rasilis* Morrison.

This species is quite widely distributed through the Atlantic States.

**Genus HILLIA Grote**

There are three species in this genus. They are found in the more temperate regions of our territory, being confined to the Northern States or to high elevations among the mountains of the West.

(1) *Hillia algens* Grote, Plate XIX, Fig. 35, ♂.

This obscurely colored moth is found in Maine, northern New York, southern Canada, and among the mountains of Colorado, Wyoming, and Montana.

**Genus HADENA Schrank**

This is a very large genus which is represented in both the Old World and New. More than one hundred species are credited to our fauna. Of these we have selected a number for purposes of illustration, knowing that familiarity with these will enable the young collector presently to recognize other species, which he will then be able to determine with the help of accessible literature.

(1) *Hadena bridghami* Grote & Robinson, Plate XX, Fig. 2, ♂. (Bridgham's Hadena.)

A bright little species, the reddish color of the medial area of the fore wings being quite distinctive. It is found in the Appalachian Subregion.

(2) *Hadena transfrons* Neumœgen, Plate XX, Fig. 7, ♀. (Neumœgen's Hadena.)

Closely allied to the preceding species, but with darker primaries, and dark hind wings. Habitat Alberta and British Columbia.
(3) **Hadena violacea** Grote, Plate XX, Fig. 12, ♂. (The Violet Hadena.)

This species, which ranges over the region of the Rocky Mountains from Colorado to California, may be distinguished from the preceding two species by its somewhat larger size, and by the fact that the secondaries are immaculately white.

(4) **Hadena claudens** Walker, Plate XX, Fig. 6, ♂. (The Dark-winged Hadena.)

*Syn. hilli* Grote.

This species is apparently confined to the northern portion of the Atlantic Subregion.

(5) **Hadena modica** Guenée, Plate XX, Fig. 14, ♂. (The Black-banded Hadena.)

*Syn. subcedens* Walker.

Ranges from the Atlantic coast to the mountains of Colorado.

(6) **Hadena characta** Grote, Plate XX, Fig. 3, ♂. (The Double-banded Hadena.)

The habitat of this species is in the southwestern portion of the Rocky Mountains. It is not uncommon in Arizona.

(7) **Hadena mactata** Guenée, Plate XX, Fig. 8, ♀. (The Dark-spotted Hadena.)

The distribution of this species is over the Appalachian Subregion and westward to the eastern ranges of the Rocky Mountains.

(8) **Hadena turbulenta** Hübner, Plate XX, Fig. 16, ♂. (The Turbulent Hadena.)

*Syn. arcuata* Walker.

This little species is not uncommon in the Atlantic Subregion.

(9) **Hadena versuta** Smith, Plate XX, Fig. 4, ♂. (The Albertan Hadena.)

So far as is now known this species is found in the Territory of Alberta, but it probably has a wide range on the eastern slopes of the northern ranges of the Rocky Mountains.

(10) **Hadena miseloides** Guenée, Plate XX, Fig. 15, ♀. (The White-spotted Hadena.)

This is not a scarce species in the Atlantic States. It may easily be recognized by its greenish fore wings, generally marked near the middle by a large white spot.
Noctuidæ

(11) Hadena chlorostigma Harvey, Plate XX, Fig. 13. ♂. (The Green-spotted Hadena.)

This species is variable in color, some specimens having green spots on the disk of the fore wings, others being, as represented in the plate, almost entirely brown. It is a common species in the central portions of the Mississippi Valley, ranging thence southward. The example figured was taken at Columbus, Ohio.

(12) Hadena fractilinea Grote, Plate XX, Fig. 10, ♂. (The Broken-lined Hadena.)

Not a scarce species in the Appalachian Subregion.

(13) Hadena basilinea Fabricius, Plate XX, Fig. 9, ♂. (The Base-streaked Hadena.)

Syn. cerivana Smith.

This species, which is also found in Europe, occurs in Alberta, and the northwestern portions of British North America.

(14) Hadena passer Guenée, Plate XIX, Fig. 36, ♂. (The Passerine Hadena.)

Syn. incallida Walker; loculata Morrison; viralis Grote; conspicua Morrison.

Not a very common species, ranging from southern Canada and the northern Atlantic States westward in the same latitudes to the Pacific, and southward into the mountains of Colorado.

(15) Hadena burgessi Morrison, Plate XIX, Fig. 37, ♂. (Burgess's Hadena.)

Syn. discors Grote.

The habitat of this well-marked species is the Atlantic Subregion and the valley of the Mississippi as far west as the Great Plains.

(16) Hadena vultuosa Grote, Plate XX, Fig. 11, ♂. (The Airy Hadena.)

Not a very common species, confined to the Atlantic Subregion.

(17) Hadena lateritia Hübnner, Plate XIX, Fig. 38, ♂. (The Red-winged Hadena.)

Syn. molochina Hübnner; obliviosa Walker.

Found throughout temperate North America and Europe.

(18) Hadena dubitans Walker, Plate XIX, Fig. 39, ♀. (The Halting Hadena.)

Syn. insignata Walker; sputatrix Grote.
Much darker than the preceding species, which it somewhat resembles. It is found in the northern portions of the Atlantic Subregion.

(19) Hadena ducta Grote, Plate XIX, Fig. 40, ♀. (The Speckled Gray Hadena.)
The range of this species is the same as that of the last mentioned.

(20) Hadena devastatrix Brace, Plate XIX, Fig. 44, ♂. (The Destroying Hadena.)
Syn. ordinaria Walker; contenta Walker; marshallana Westwood.
Universally distributed throughout the United States and southern Canada.

(21) Hadena arctica Boisduval, Plate XIX, Fig. 45, ♂. (The Northern Hadena.)
Syn. amputatrix Fitch.
A large and handsome species, easily recognizable. It ranges from Canada and New England into the Carolinas and westward to Colorado.

(22) Hadena occidens Grote, Plate XX, Fig. 20, ♂. (The Great Western Hadena.)
The species is distributed from Colorado to California.

(23) Hadena verbascoides Guenée, Plate XIX, Fig. 43, ♀. (The Mullein Hadena.)
A peculiarly marked species, which cannot easily be mistaken for anything else. It occurs in the northern Atlantic States.

(24) Hadena nigrior Smith, Plate XIX, Fig. 42, ♀. (The Darker Hadena.)
Allied to the preceding species, but with the light color of the costal area confined to the basal portion of the wing. Found in New England and Canada.

(25) Hadena lignicolor Guenée, Plate XX, Fig. 5, ♂. (The Wood-colored Hadena.)
A well-marked species, in color recalling H. vultuosa, but larger. It ranges from the Atlantic to Colorado and Arizona.

(26) Hadena semilunata Grote, Plate XXII, Fig. 41, ♂. (The Half-moon Hadena.)
Not uncommon in Colorado and ranging thence westward to the Pacific.
Noctuidæ

(27) Hadena vinela Smith, MS., Plate XX, Fig. 19, ♂. (The Dark Ashen Hadena.)

This species has been long distributed in collections as Fishea enthea, which it is not. I apply to the figure the manuscript name, which has been given me by Prof. J. B. Smith. It is found in New England and southern Canada.

Genus CALOPHASIA Stephens

The only species of this genus credited to our fauna is C. strigata Smith, represented in Plate XX, Fig. 17, by a female specimen, loaned to me by the United States National Museum. It occurs in Colorado and Wyoming.

Genus EPIDEMAS Smith

This genus was erected by Professor J. B. Smith for the reception of the species figured in Plate XXIII, Fig. 2, from a female specimen in the National Collection, and named by him cinerea. It occurs in Colorado.

Genus MACRONOCTUA Grote

(1) Macronoctua onusta Grote, Plate XX, Fig. 18, ♀. There is only one species of this genus, which occurs in the southern Atlantic States.

Genus FISHEA Grote

A small genus. There are only two species known.

(1) Fishea yosemitæ Grote, Plate XX, Fig. 1, ♂. (The Yosemite Fishea.)

This species, which is generally referred to the genus Aporophila Guenée, is placed here on the authority of Prof. J. B. Smith. In addition to the figure given in the plate we have inserted a cut drawn from the type. By the help of these the student will no doubt be able to identify the species. The insect is found in California.
Genus POLIA Hübner

A moderately large genus, which includes about twenty species in our fauna. Of these we have selected two for illustration.

(1) Polia theodori Grote, Plate XX, Fig. 21, ♂. (Theodore's Polia.)

The home of this species is the southwestern portion of the region of the Rocky Mountains.

(2) Polia diversilineata Grote, Plate XX, Fig. 22, ♂. (The Varied-banded Polia.)

Syn. illepida Grote.

Like the preceding species this is an inhabitant of the Rocky Mountains.

Genus DRYOBOTA Lederer

(1) Dryobota illocata Walker, Plate XX, Fig. 24, ♀. (The Wandering Dryobota.)

Syn. stigmata Grote.

A native of the Atlantic Subregion wandering as far west as Colorado.

Genus HYPPA Duponchel

The genus is found in both hemispheres. Four species are credited to North America.

(1) Hyppa xylinoides Guenée, Plate XX, Fig. 23, ♀. (The Common Hyppa.)

Syn. contraria Walker; ancocisconensis Morrison.

A very common species in the Atlantic Subregion. It is freely attracted to light in the spring of the year.

Genus FERALIA Grote

A small genus containing four species in our territory. The insects are generally found in groves of pine.

(1) Feralia jocosa Guenée, Plate XVII, Fig. 32, ♂. (The Joker.)

Found in suitable localities throughout the northern Atlantic States.
Noctuidæ

**Genus MOMOPHANA Grote**

The only species of this genus known is a very rare insect so far as has been ascertained. The cut we give was drawn from a unique specimen in the Neumögen Collection at the Brooklyn Institute. The type is at Cornell University. All the specimens which have been taken have occurred in New York and Canada.

**Genus VALERIA Germar**

This genus occurs on both sides of the Atlantic. The only species in our fauna is *Valeria opina* Grote, the male of which is figured in Plate XX, Fig. 25. It is found in California.

**Genus EUPLEXIA Stephens**

But one species of this genus, which is also found in Europe, occurs in North America. English entomologists call the moth "The Small Angle Shades." The scientific name is *Euplexia lucipara* Linnaeus, and it is depicted on Plate XX, Fig. 26. It occurs all over the United States and Canada.

**Genus TRACHEA Hübner**

This genus is also found in both hemispheres. Only one species is found in America, and is confined to the Atlantic Subregion. It is known as *Trachea delicata* Grote, and the male is shown on Plate XX, Fig. 27.

**Genus DIPTERYGIA Stephens**

The genus *Dipterygia* is represented in the New World by the species named *scabriuscula* by Linnaeus, which also occurs in Europe. There are several Asiatic species. It is shown on Plate XX, Fig. 28. It ranges from the Atlantic westward to the Rocky Mountains.

**Genus ACTINOTIA Hübner**

This small genus is represented in the United States and Canada by the insect to which Guenée applied the specific name.
ramosula, and which is delineated on Plate XX, Fig. 29. It is very common in Pennsylvania.

Genus PYROPHILA Hübner

This genus is better represented in Europe and Asia than in America.

1) Pyrophila glabella Morrison, Plate XX, Fig. 32, ♂. (The Gray Pyrophila.)

Not nearly as common as the next species, but widely distributed throughout the United States and Canada.

2) Pyrophila pyramidoides Guenée, Plate XX, Fig. 30, ♂. (The American Copper Underwing.)

This insect, which is one of the commonest moths in the Atlantic Subregion, and ranges westward as far as Colorado, conceals itself under the loose bark of trees during the daytime, and comes forth at night. It sometimes fairly swarms at sugar, and becomes a veritable pest to the collector, who desires rarer things. The caterpillar does a good deal of damage to vegetation. I have recently been annoyed by the ravages inflicted by the larvae in the spring of the year upon the foliage of imported rhododendrons, for which they seem to have a partiality in my garden. They feed freely on a great variety of shrubs and herbaceous plants.

3) Pyrophila tragopoginis Linnaeus, Plate XX, Fig. 31, ♂. (The Mouse-colored Pyrophila.)

Syn. repressus Grote.

A circumpolar species ranging throughout the temperate zone.

Genus HELIOTROPHA Lederer

The genus is represented in the Atlantic States by a species, of which a light and a dark form occur. The typical, or light form, was named reniformis by Grote, and is depicted on Plate XX, Fig. 33, while the dark form, named atra by the same author, is shown on the same plate by Figure 34.

173
Noctuidæ

Genus PRODENIA Guenée

A small but widely distributed genus found in all parts of the globe. Illustrations of two of the three species found in our fauna are given.

(1) Prodenia commelinae Abbot & Smith, Plate XX, Fig. 36, ♀.

This species, which occurs in the Atlantic Subregion, is common in the southern portion of its range.

(2) Prodenia ornithogalli Guenée, Plate XX, Fig. 35, ♂.

Not as common as the preceding species, but ranging over the entire United States.

Genus LAPHYGMA Guenée

A small but widely distributed genus, represented in our fauna by but one species.

(1) Laphygma frugiperda Abbot & Smith, Plate XX, Fig. 37, ♂. (The Fall Army Worm.)

Syn. macra Guenée; signifera Walker; plagiata Walker; autumnalis Riley.

This destructive insect, which is found all over the Atlantic States, the Mississippi Valley, and thence southward through Central and South America, feeds in its larval state upon a great variety of succulent plants, showing, however, a decided prefer-
ence for the cereals. It does considerable damage to garden crops, and attacks cotton. It is said to inflict damage upon winter wheat, blue-grass, and timothy. The moth is variable in its markings. The typical form is represented on Plate XX, and by the upper figure in the annexed cut. It has frequently been mistaken by observers for the true Army Worm (Leucania unipuncta). Because its ravages are generally committed in the fall of the year it was named The Fall Army Worm by the late Prof. C. V. Riley. A very excellent account of the insect is given by this distinguished authority in the “Eighth Annual Report” of the State Entomologist of Missouri, p. 48, et seq., which the student will do well to consult. It is from this article that the two accompanying figures have been taken.

Genus LUSSA Grote

(1) Lussa nigroguttata Grote, Plate XX, Fig. 38, ♂. This little moth is found in Florida. Not much is as yet known in regard to its life-history.

Genus MAGUSA Walker

(1) Magusa dissidens Felder, Plate XXI, Fig. 2, ♂. Syn. divaricata Grote; angustipennis Moescher; divida Moeschler. The sole species of the genus found within our territory, ranging from the southern Atlantic States into South America.

Genus PSEUDANARTA Henry Edwards

We figure three of the five species attributed to this genus and reported to occur within the limits of the United States.

(1) Pseudanarta flava Grote, Plate XX, Fig. 39, ♂. (The Yellow Pseudanarta.) Syn. crocea Henry Edwards. The range of this species is from Colorado and Arizona to the southern portions of British Columbia.

(2) Pseudanarta singula Grote, Plate XX, Fig. 40, ♂. (The Single Pseudanarta.) The habitat of this species is the southwestern United States.

(3) Pseudanarta falcata Neumoegen, Plate XX, Fig. 41, ♂. (The Falcate Pseudanarta.) The species occurs in Arizona and Mexico.
Noctuidæ

Genus HOMOHADENA Grote

A considerable genus, one species of which we represent.

(1) Homohadena badistriga Grote, Plate XXI, Fig. 1, ♂ .
This is the only species of the genus, which occurs in the northern Atlantic States. Most of them are western and southern. The range of badistriga is from the Atlantic to Colorado.

Genus ONOCNEMIS Lederer

An extensive genus, in which are included over forty species, most of which are found in the western and southwestern States. We have selected for representation seven of their number.

(1) Oncocnemis dayi Grote, Plate XXI, Fig. 4, ♂ . (Day's Oncocnemis.)
Not an uncommon species in Colorado and Wyoming.

(2) Oncocnemis tenuifascia Smith, Plate XXI, Fig. 5, ♂ .
(The Narrow-banded Oncocnemis.)
The distribution of this species is the same as that of the last mentioned.

(3) Oncocnemis occata Grote, Plate XXI, Fig. 8, ♀ . (The Harrow-moth.)
This species occurs in Texas, Colorado, and the States lying westward of these, as far as the Pacific.

(4) Oncocnemis chandleri Grote, Plate XXI, Fig. 7, ♀ .
(Chandler's Oncocnemis.)
Indigenous to the Rocky Mountains.

(5) Oncocnemis atrifasciata Morrison, Plate XXI, Fig. 3, ♀ .
(The Black-banded Oncocnemis.)
This fine species is found in the northern portions of the Atlantic Subregion. The specimen figured was taken in Maine.

(6) Oncocnemis iricolor Smith, Plate XXI, Fig. 6, ♀ .
(The Iris-colored Oncocnemis.)
So far this species has only been reported from Colorado and Wyoming.

(7) Oncocnemis cibalis Grote, Plate XXI, Fig. 9, ♂ . (The Gray Oncocnemis.)
The only specimens so far found have been taken in Colorado.
Explanation of Plate XX

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Fishia yosemita Grote, ♀.
3. Hadena characta Grote, ♀.
4. Hadena versuta Smith, ♀.
5. Hadena ignicolor Guenée, ♂.
8. Hadena maactata Guenée, ♀.
9. Hadena basilinea Fabricius, ♀.
11. Hadena vultuosa Grote, ♀.
13. Hadena chlorostigma Harvey, ♂.
15. Hadena miseloides Guenée, ♀.
17. Calophasia strigata Smith, ♀.
18. Macromoctua onusta Grote, ♀.
22. Polia diversilineata Grote, ♂.
23. Hyppa xylinoides Guenée, ♀.
25. Valeria opina Grote, ♂.
27. Trachea delicata Grote, ♂.
29. Actinotia ramosula Guenée, ♀.
30. Pyrophila pyramidoidea Guenée, ♂.
31. Pyrophila tragopoginis Linnaeus, ♂.
32. Pyrophila glabella, Morrison, ♂.
33. Helotropha reniformis Grote, ♀.
34. Helotropha reniformis var. atra, Grote, ♀.
35. Prodenia ornithogalli Guenée, ♀.
36. Prodenia commelina Abbot & Smith, ♀.
37. Laphygma frugiperda Abbot & Smith, ♂.
38. Lussa nigroguttata Grote, ♂.
39. Pseudanarta flavà Grote, ♂.
40. Pseudanarta singula Grote, ♂.
41. Pseudanarta falcata Neumégen, ♂.
Genus LEPIPOLYS Guenée

(1) Leipolys perscripta Guenée, Plate XXI, Fig. 11, ♀.
Only one species occurs in our territory, ranging from the Atlantic to the Pacific.

Genus ADITA Grote

(1) Adita chionanthi Abbot & Smith, Plate XXI, Fig. 10.
A rather rare moth, which is found in the Atlantic Subregion, but is much commoner in Colorado and Wyoming. It is the only representative of its genus.

Genus COPIPANOLIS Grote

A small genus said to contain four species, which are not as distinctly separable as might be desired.
(1) Copipanolis cubilis Grote, Plate XXI, Fig. 12, ♀.
The habitat of this insect is the northern United States. It appears upon the wing in Pennsylvania early in April.

Genus EUTOLYPE Grote

(1) Eutolype bombyciformis Smith, Plate XXI, Fig. 13, ♀.
The genus represented by this species contains four others within our limits. They all occur in the Atlantic Subregion, except the species named damalis by Grote, which is Californian.

Genus PSAPHIDIA Walker

Of the four species of this genus occurring within our territory we give illustrations of two.
(1) Psaphidia grotei Morrison, Plate XXI, Fig. 14, ♀.
The home of this species is the northern Atlantic States. It occurs upon the wing very early in the spring of the year.
(2) Psaphidia resumens Walker, Plate XXI, Fig. 15, ♀.
Syn. viridescens Walker; muralis Grote.
The range of this insect is the same as that of the preceding species.

Genus CERAPODA Smith

Only one species of this genus is known. It was named Cerapoda stylata by Prof. J. B. Smith, and is shown on Plate XXIII, Fig. 1. Its habitat is Colorado.
Noctuidae

Genus FOTA Grote

There are two species of this genus, both of which we figure. They both occur in Arizona and Mexico.
(1) Fota armata Grote, Plate XXI, Fig. 16, ♀.
(2) Fota minorata Grote, Plate XXI, Fig. 17, ♂.
We do not recall any description of the habits of these two species.

Genus PODAGRA Smith

This genus has been quite recently erected by Smith for the reception of the species, a representation of the type of which, based upon the specimen in the United States National Museum, is given in Fig. 99.

Genus RHYNCHAGROTIS Smith

Over twenty species have been attributed to this genus. Of these we figure six.
(1) Rhynchagrotis gilvipennis Grote, Plate XXI, Fig. 18, ♀. (The Catocaline Dart-moth.)
This pretty species is found in the northern parts of the United States, in Canada, and British America. It is scarce in the eastern parts of its range south of Maine and the Adirondack Woods.
(2) Rhynchagrotis rufipectus Morrison, Plate XXI, Fig. 22, ♀. (The Red-breasted Dart-moth.)
The general distribution of this species is like the former, but it extends much farther southward.
(3) Rhynchagrotis minimalis Grote, Plate XXI, Fig. 21, ♀. (The Lesser Red Dart-moth.)
This species is found in Maine, southern Canada, and also in Colorado, Wyoming, and Montana.
(4) Rhynchagrotis anchocelioides Guenée, Plate XXI, Fig. 19, ♀.
Syn. cupida Grote; velata Walker.
A common species in the northern Atlantic Subregion, extending its habitat to the region of the Rocky Mountains.
(5) Rhynchagrotis placida Grote, Plate XXI, Fig. 23, ♂. (The Placid Dart-moth.)
Noctuidae

A very common species in the northern United States, found as far westward as the Rocky Mountains.

(6) **Rhynchagrotis alternata** Grote, Plate XXI, Fig. 20, ♀.

(The Greater Red Dart-moth.)

This species closely resembles in general appearance the species named *minimalis*, but may be distinguished by its larger size, and the darker color of the hind wings.

**Genus ADELPHAGROTIS** Smith

Of the five species belonging to the genus we select the commonest for illustration.

(1) **Adelphagrotis prasina** Fabricius, Plate XXI, Fig. 24, ♀.

(The Green-winged Dart-moth.)

This insect occurs all over Canada, the northern Atlantic States, the Rocky Mountains, and British Columbia. It occurs also in Europe.

**Genus PLATAGROTIS** Smith

The species of this genus are confined to the more temperate regions of our territory.

(1) **Platagrotis pressa** Grote, Plate XXI, Fig. 25, ♂. (The Dappled Dart.)

Occurs in the northern portions of the Atlantic Subregion.

**Genus EUERETAGROTIS** Smith

Three species of the genus occur, all of them within the Atlantic Subregion.

(1) **Eueretagrotis sigmoides** Guenée, Plate XXI, Fig. 26, ♂.

(The Sigmoid Dart.)

From the following species distinguished readily by its larger size, and the darker coloration of the fore wings.

(2) **Eueretagrotis perattenta** Grote, Plate XXI, Fig. 27, ♀.

(The Two-spot Dart.)

A common species in the Atlantic States.

"Yon night moths that hover where honey brims over."

Jean Ingelow. *Songs of Seven.*

179
Noctuidæ

Genus ABAGROTIS Smith

Only one species is attributed to this genus. It is represented by the accompanying cut, drawn from the type in the United States National Museum. Abagrotis erratica is thus far only recorded from California. It is rare in collections. The color of the wings is ashen gray in some specimens; in others pale reddish.

Genus SEMIOPHORA Stephens

(1) Semiophora elimata Guenée, Plate XXI, Fig. 29, ♀. Form janualis Grote, Plate XXI, Fig. 30, ♂. (The Variable Dart.)

Syn. dilucidula Morrison; badicollis Grote.
Not at all an uncommon species, ranging from Canada to Georgia.

(2) Semiophora opacifrons Grote, Plate XXI, Fig. 28, ♀. (The Black-fronted Dart.)
This species is found in the more northern portions of the Atlantic Subregion ranging into Quebec.

(3) Semiophora tenebrifera Walker, Plate XXI, Fig. 33, ♂. (The Reddish Speckled Dart.)
Syn. catharina Grote; manifestolabes Morrison.
A well-marked species, the fore wings of which have a prevalently reddish cast. It ranges from New Jersey northward into Canada.

Genus PACHNOBIA Guenée

The species are mainly boreal, being found in the northern portions of our territory, principally in Canada, and on the higher mountain ranges.

(1) Pachnobia littoralis Packard, Plate XXI, Fig. 32, ♂.
(The Reddish Pachnobia.)
Syn. pectinata Grote; ferruginoides Smith.
The species occurs from the mountains of Colorado northward to Alberta.

(2) Pachnobia salicarum Walker, Plate XXI, Fig. 31, ♂.
(The Willow Pachnobia.)
Syn. orilliana Grote; claviformis Morrison.
Noctuidae

This species, readily distinguished from all others by the well defined claviform spot, ranges from Massachusetts to Alberta and northward.

Genus METALEPSIS Grote

Two species of this genus are credited to our fauna. Of the type of one of these, preserved in the British Museum, I am able to give an excellent figure taken from Sir George F. Hampson's fine work upon the moths of the world, which is being published by the Trustees of the above named institution. The insect occurs in California.

Genus SETAGROTIS Smith

Eight species, all of them found in the northern parts of our territory or at considerable elevations among the mountains of the West, are attributed to this genus. I am able to give a figure of one of these, which Dr. Dyar kindly had drawn from the type in the United States National Museum. It occurs among the mountains of Colorado and Wyoming. The ground color of the wings is pale luteous.

Genus AGROTIS Ochsenheimer

(1) Agrotis badinodis Grote, Plate XXI, Fig. 37, ♂. (The Pale-banded Dart.)

Not an uncommon species in the northern Atlantic States and Canada.
Noctuidæ

(2) **Agrotis ypsilon** Rottemburg. (The Ypsilon Dart.)

Syn. *suffusa* Denis & Schiffermüller; *telifera* Harris; *idonea* Cramer.

This is an exceedingly common species, which occurs everywhere in Canada and the United States. It is also found in Europe. Its larva is one of the species, which under the name of "cut-worms," are known to inflict extensive injuries upon growing plants. They burrow into the loose soil during the day, and come forth at night and do their mischievous work. They are a plague to the market-gardener in particular.

(3) **Agrotis geniculata** Grote & Robinson, Plate XXI, Fig. 36, ♀. (The Knee-joint Dart.)

Not a scarce species in the northern Atlantic Subregion.

**Genus PERIDROMA Hübner**

This is a moderately large genus, represented in the United States and Canada by about a dozen species. Half of these we illustrate.

(1) **Peridroma occulta** Linnaeus, Plate XXI, Fig. 42, ♀. (The Great Gray Dart.)

The habitat of this insect is the northern portion of our territory.

(2) **Peridroma astricta** Morrison, Plate XXI, Fig. 41, ♀. (The Great Brown Dart.)

The species is found in the northern parts of the Atlantic Subregion, and also in Colorado.

(3) **Peridroma nigra** Smith, Plate XXI, Fig. 43, ♀. (The Great Black Dart.)

Found in Colorado and Wyoming.

(4) **Peridroma saucia** Hübner, Plate XXI, Fig. 40, ♀; Egg, Text-figure No. 2. (The Common Cut-worm.)

Syn. *inermis* Harris; *ortonii* Packard.

Almost universally distributed throughout the United States and southern Canada. It also occurs in Europe.
Explanation of Plate XXI

(Except when otherwise indicated the specimens are contained in the collection of W. J. Holland.)

Noctuidae

(5) **Peridroma incivis** Guenée, Plate XXI, Fig. 39, ♂. (The Uncivil Dart.)
   Syn. *alabama* Grote.
   Ranges from the Atlantic to the Pacific.

(6) **Peridroma simplaria** Morrison, Plate XXI, Fig. 38, ♀. (The Pale-winged Dart.)
   Not an uncommon species in Texas and Arizona.

**Genus NOCTUA** Linnæus

This is a very extensive genus, to which over forty species found in our territory are referred in recent lists.

(1) **Noctua normanniana** Grote, Plate XXI, Fig. 34, ♂. (Norman’s Dart.)
   Syn. *obtusa* Speyer.
   Found everywhere in the Atlantic Subregion.

(2) **Noctua bicarnea** Guenée, Plate XXI, Fig. 35, ♀. (The Pink-spotted Dart.)
   This is likewise a common species ranging from the Atlantic as far west as Colorado.

(3) **Noctua c-nigrum** Linnaeus, Plate XXII, Fig. 1, ♀. (The Black-letter Dart.)
   Universally distributed through the Appalachian Subregion and also occurring in Europe.

(4) **Noctua jucunda** Walker, Plate XXII, Fig. 5, ♀. (The Smaller Pinkish Dart.)
   Syn. *perconflua* Grote.
   Very commonly found in the northern United States.

(5) **Noctua oblata** Morrison, Plate XXII, Fig. 3, ♂. (The Rosy Dart.)
   Syn. *hilliana* Harvey.
   The habitat of this species is the North. It is common in Alberta.

(6) **Noctua fennica** Tauscher, Plate XXII, Fig. 4, ♂. (The Finland Dart.)
   A circumpolar species found throughout northern Europe, Asia, and America.

183
Noctuidæ

(7) Noctua plecta Linnaeus, Plate XXII, Fig. 6, ♂. (The Flame-shouldered Dart.)
Syn. vicaria Walker.
The distribution of this small and well-marked species is somewhat like that of the preceding, but it extends farther to the south.
(8) Noctua collaris Grote & Robinson, Plate XXII, Fig. 7, ♂. (The Collared Dart.)
Occurs in the northern parts of the Atlantic Subregion.
(9) Noctua juncta Grote, Plate XXII, Fig. 12, ♂. (The Scribbled Dart.)
Syn. patefacta Smith.
The species ranges from Nova Scotia to Alberta.
(10) Noctua haruspica Grote, Plate XXII, Fig. 9, ♀. (The Soothsayer Dart.)
Syn. grandis Speyer.
Widely distributed through the northern portions of our territory.
(11) Noctua clandestina Harris, Plate XXII, Fig. 14, ♀. (The Clandestine Dart.)
Syn. unicolor Walker; nigriceps Walker.
A common species ranging from the Atlantic to the Rocky Mountains, and readily separated from the preceding species by the narrower and darker fore wings.
(12) Noctua havilæ Grote, Plate XXII, Fig. 18, ♂. (The Havilah Dart.)
A smaller species than either of the preceding. It occurs from Colorado and Wyoming westward to California.
(13) Noctua atricincta Smith, Plate XXII, Fig. 11, ♂. (The Black-girdled Dart.)
Thus far this species has only been reported as occurring in Alberta.
(14) Noctua substrigata Smith, Plate XXII, Fig. 10, ♂. (The Yellow-streaked Dart.)
This species, like the preceding, is found in Alberta. Both probably have a wider range.
(15) Noctua calgary Smith, Plate XXII, Fig. 13, ♂. (The Calgary Dart.)
The remarks made as to the two preceding species apply to this also.

184
(16) Noctua lubricans Guenée, Plate XXII, Fig. 8, ♂. (The Slippery Dart.)

Syn. associans Walker; illapsa Walker; beata Grote.

A very common species, universally distributed throughout the United States.

Genus PRONOCTUA Smith

Only one species of this genus, named typica by Prof. J. B. Smith, is known. It is found in Colorado and Wyoming. Through the kindness of Dr. Dyar a drawing of the type was made for me at the United States National Museum and it is reproduced in the annexed cut (Fig. 104).

Genus CHORIZAGROTIS Smith

Eight species are attributed to this genus by Dyar in his recent Catalogue of the moths of the United States. We figure three of them.

(1) Chorizagrotis introferens Grote, Plate XXII, Fig. 15, ♀. (The Interfering Dart.)

This insect is not scarce in Texas and Colorado, and thence ranges westward to California.

(2) Chorizagrotis inconcinna Harvey, Plate XXII, Fig. 22, ♀. (The Inelegant Dart.)

An obscurely colored species occurring in the southwestern States.

(3) Chorizagrotis balanitis Grote, Plate XXII, Fig. 17, ♂. (The Acorn Dart.)

The range of this insect is from Colorado to British Columbia.

Genus RHIZAGROTIS Smith

About a dozen species have been assigned to this genus by recent writers. We figure one of them, to which Prof. J. B. Smith has applied the name proclivis. It is represented by a female specimen on Plate XXII, Fig. 16. The insect occurs in Arizona and northern Mexico.
Genus FELTIA Walker

This is a considerable genus, represented by species in the northern portions of both hemispheres.

(1) Feltia subgothica Haworth. (The Subgothic Dart.)

Of this common species, which is found in the northern portions of the United States and also in Canada, and which likewise occurs in Europe, we give a figure on Plate XXII. We also have reproduced a cut of the species taken from Prof. C. V. Riley's First Missouri Report. The larva is one of the commonest cut-worms, found more abundantly, however, in the West than in the East. The species has a wide range over the northern portions of the United States and through southern Canada.

(2) Feltia herilis Grote, Plate XXII, Fig. 20, ♂. (The Master's Dart.)

The insect ranges from the Atlantic to the Rocky Mountains.

(3) Feltia gladiaria Morrison, Plate XXII, Fig. 19, ♀. (The Swordsman Dart.)

Syn. morrisoniana Riley.

The distribution of this species is the same as that of the previous.

(4) Feltia venerabilis Walker, Plate XXII, Fig. 26, ♂. (The Venerable Dart.)

Widely distributed throughout the United States.

(5) Feltia vancouverensis Grote, Plate XXII, Fig. 42, ♀. (The Vancouver Dart.)

Syn. hortulana Morrison; semiclarata Grote; agilis Grote.

I have given the above name to the specimen figured on the Plate as cited upon the authority of Prof. J. B. Smith, who has kindly examined the figure. The specimen came from Labrador.

(6) Feltia volubilis Harvey, Plate XXII, Fig. 23, ♀. (The Voluble Dart.)

Syn. stigmosa Morrison.
Noctuidæ

Found throughout our entire territory.

(7) **Feltia annexa** Treitschke, Plate XXII, Fig. 28, ♂. (The Added Dart.)
    Found throughout the southern Atlantic and Gulf States and ranging into South America.

(8) **Feltia malefida** Guenée, Plate XXII, Fig. 32, ♂. (The Rascal Dart.)
    This species has the same range as that of the last mentioned form.

**Genus POROSAGROTIS** Smith

Eleven species are assigned by Dr. Dyar in his Catalogue to this genus. As representatives of these we have chosen five for illustration.

(1) **Porosagrotis vetusta** Walker, Plate XXII, Fig. 25, ♂.
    (The Old Man Dart.)
    This pale-colored species extends in its range from the Atlantic to Colorado.

(2) **Porosagrotis fusca** Boisduval, Plate XXII, Fig. 31, ♀.
    (The Fuscous Dart.)
    Syn. *septentrionalis* Mæschler; *patula* Walker.
    The specimen figured was taken at Nain, Labrador. The insect is said also to occur in the Rocky Mountains.

(3) **Porosagrotis tripars** Walker, Plate XXII, Fig. 24, ♂;
    Fig. 37, ♀. (The Tripart Dart.)
    The specimens figured came from Colorado.

(4) **Porosagrotis rileyana** Morrison, Plate XXII, Fig. 33, ♀.
    (Riley’s Dart.)
    This species is spread from the Atlantic to the Rocky Mountains.

(5) **Porosagrotis dædalus** Smith, Plate XXII, Fig. 29, ♂.
    (The Dædalus Dart.)
    The insect is peculiar to the region of the Rocky Mountains.

**Genus EUXOA** Hübner

This great genus, including nearly two hundred species, which are found in the region, with which this book deals, has
in recent years been ranged under the name *Carneades* after the teaching of Grote, but as *Carneades*, which was erected by Bates, includes a different concept, this name was abandoned by Dr. Dyar, and the name *Paragrotis* Pratt was substituted for it. This name, however, must yield to the older name proposed by Hübner, and which we have adopted at the suggestion of Prof. J. B. Smith.

(1) **Euxoa quadridentata** Grote & Robinson, Plate XXII, Fig. 30, δ. (The Four-toothed Dart.)

This insect is distributed from Colorado to Oregon.

(2) **Euxoa brevipennis** Smith, Plate XXII, Fig. 27, ♀. (The Short-winged Dart.)

The range of this species is the same as that of the preceding.

(3) **Euxoa olivalis** Grote, Plate XXII, Fig. 34, δ. (The Olive Dart.)

The species occurs in Colorado and Utah.

(4) **Euxoa flavidens** Smith, Plate XXII, Fig. 38, δ. (The Yellow-toothed Dart.)

This moth is spread through the region of the Rocky Mountains from Colorado to northern Mexico. The specimen figured came from the Sierra Madre of Chihuahua. It has been compared with the type in the National Museum at Washington.

(5) **Euxoa perpolita** Morrison, Plate XXII, Fig. 36, δ. (The Polished Dart.)

It ranges from the States of the northern portion of the Atlantic Subregion to the mountains of Colorado.

(6) **Euxoa velleripennis** Grote, Plate XXII, Fig. 35, δ. (The Fleece-winged Dart.)

It has the same range as the preceding species. It may at once be distinguished from it by its slighter build, and by the whiter hind wings.

(7) **Euxoa detersa** Walker, Plate XXII, Fig. 39, δ. (The Rubbed Dart.)

Syn. *pityochrous* Grote; *personata* Morrison.

A pale and inconspicuously colored insect, which has the same distribution as the two preceding species.

(8) **Euxoa messoria** Harris, Plate XXII, Fig. 40, δ. (The Reaper Dart.)

188
EXPLANATION OF PLATE XXII

(Except when otherwise indicated the specimens figured are contained in the collection of W. J. Holland.)

1. Noctua c-nigrum Linnaeus, ♀.
2. Noctua phylophora Grote, ♀.
8. Noctua lubricans Guenee, ♂.
11. Noctua atricincta Smith, ♂.
14. Noctua clandestina Harris, ♀.
15. Chorizagrotis introferens Grote, ♀.
17. Chorizagrotis balanitis Grote, ♂.
19. Feltia gladiaria Morrison, ♀.
20. Feltia herilis Grote, ♂.
21. Feltia subgothica Haworth, ♂.

22. Chorizagrotis inconcinna Harvey, ♀.
23. Feltia volubilis Harvey, ♀.
24. Porosagrotis tripars Grote, ♂.
27. Euxoa brevipennis Smith, ♀.
28. Feltia annexa Treitschke, ♀.
29. Porosagrotis dædæus Smith, ♂.
30. Euxoa quadridentata Grote & Robinson, ♂.
31. Porosagrotis fæsca Boisduval, ♂.
32. Feltia malefida Guenee, ♀.
33. Porosagrotis rileyana Morrison, ♀.
34. Euxoa olivalis Grote, ♂.
35. Euxoa velleripennis Grote, ♂.
36. Euxoa perpolita Morrison, ♂.
37. Porosagrotis tripars Walker, ♂.
38. Euxoa flavdens Smith, ♂.
40. Euxoa messoria Harris, ♂.
41. Hadena semiinunata Grote, ♂.

42. Feltia vancouverensis Morrison, ♀.
Noctuidæ

Syn. *spissa* Guenée; *cochrani* Riley; *repentis* Grote & Robinson; *dissipiens* Walker, etc.

This wretched little creature, the larva of which is one of our most destructive cut-worms, was described seven times by Walker under different names. The more inconspicuous, or the smaller an insect, the more names it bears. The littlest bugs have the biggest names. It is thus also, sometimes, with men.

(9) *Euxoa lutulenta* Smith, Plate XXIII, Fig. 13, ♂. (The Muddy Dart.)

An inconspicuous species, which ranges from Alberta in the north to Colorado in the south, and thence westward to California.

(10) *Euxoa dissona* Mœschler, Plate XXIII, Fig. 5, ♀. (The Dissonant Dart.)

This moth is found in Labrador.

(11) *Euxoa titubatis* Smith, Plate XXIII, Fig. 6, ♂. (The Tippling Dart.)

The distribution of this species is coincident with that of the preceding.

(12) *Euxoa insulsa* Walker, Plate XXIII, Fig. 3, ♀. (The Silly Dart.)

Syn. *insignata* Walker; *expulsa* Walker; *declarata* Walker; *decolor* Morrison; *campestris* Grote; *verticalis* Grote.

This is another poor creature, which unconsciously has suffered much at the hands of the species-makers. It is found all over the United States.

(13) *Euxoa albipennis* Grote, Plate XXIII, Fig. 7, ♂. (The White-winged Dart.)

Syn. *nigripennis* Grote.

A common species in the Atlantic Subregion ranging across the valley of the Mississippi into Colorado.

(14) *Euxoa tessellata* Harris, Plate XXIII, Fig. 4, ♂. (The Tessellate Dart.)

Syn. *maizi*, Fitch; *atropurpurea* Grote.

Universally distributed throughout our region.

(15) *Euxoa basalis* Grote, Plate XXIII, Fig. 8, ♂. (The Basal Dart.)

This species is found in Colorado and Wyoming, and probably has a still wider range.
(16) **Euxoa ochrogaster** Guenée, Plate XXIII, Fig. 10, ♂. (The Yellow-bellied Dart.)

Syn. *illata* Walker; *cinereomaculata* Morrison; *gularis* Grote; *turris* Grote.

This moth is found in the northern Atlantic States and thence westward to the foothills of the Rocky Mountains.

(17) **Euxoa furtivus** Smith, Plate XXIII, Fig. 11, ♂. (The Furtive Dart.)

The habitat of this species is the region of the Rocky Mountains.

(18) **Euxoa obeliscooides** Guenée, Plate XXIII, Fig. 12, ♀. (The Obelisk Dart.)

Syn. *sexatilis* Grote.

Distributed over the northern Atlantic States, and across the valley of the Mississippi to Wyoming and Colorado.

(19) **Euxoa redimicula** Morrison, Plate XXIII, Fig. 9, ♂. (The Fillet Dart.)

The insect has exactly the same range as the last mentioned species.

**Genus EUCOPTOCNEMIS** Grote

There is but one species of the genus recognized in our fauna. To this Guenée gave the name *fimbriaris*. It was afterward named *obvia* by Walker. Its habitat is New England. It is a scarce species in collections. The figure we give was taken from a specimen in the United States National Museum.

**Genus RICHIA** Grote

A small genus of obscurely colored moths. They are found in the southwestern States.

(1) **Richia aratrix** Harvey, Plate XXIII, Fig. 14, ♂. (The Plough-girl.)

The species is found in Colorado and Texas.

(2) **Richia parentalis** Grote, Plate XXIII, Fig. 15, ♂. (The Parental Dart.)
This is a New Mexican species. It also occurs in Texas, and in the mountains of northern Mexico.

**Genus ANYTUS Grote**

Only a few species have been recognized as belonging to this genus. Of the five which have been named, we figure two.

(1) *Anytus privatus* Walker, Plate XXIII, Fig. 16, ♂. (The Sculptured Anytus.)
    Syn. *sculptus* Grote.
    A native of the Atlantic Subregion.

(2) *Anytus obscurus* Smith, Plate XXIII, Fig. 17, ♂. (The Obscure Anytus.)
    Thus far this insect has only been reported from Alberta.

**Genus UFEUS Grote**

A small genus of rather large, plainly colored moths, having a robust habitus, which permits them to be easily distinguished from others.

(1) *Ufeus plicatus* Grote, Plate XXIII, Fig. 19, (The Pleated Ufeus.)
    Syn. *barometricus* Goossens.
    Distributed over the northern Atlantic States, and westward as far as California. The insect is not, however, very common.

(2) *Ufeus satyricus* Grote, Plate XXIII, Fig. 20, ♂. (The Satyr.)
    This moth ranges over the northern Atlantic States, but, like the other species of the genus, does not appear to be anywhere very common.

**Genus AGROTIPHILA Grote**

There are seven species attributed to this genus by recent authors. We can only figure one of them.

(1) *Agrotiphila incognita* Smith, Plate XXIII, Fig. 18, ♂.
    The species occurs in Alberta and westward to British Columbia.

**Genus MAMESTRA Ochsenheimer**

A very large genus, represented in both hemispheres by a large number of species. The caterpillars of some species are
Noctuidae

quite destructive to cultivated plants. Of the one hundred and ten or more species occurring in our territory we have selected thirty for purpose of illustration. This number of species, if correctly ascertained by the student, ought to enable him to form some idea of the general character of the complex of insects, with which we are now dealing.

(1) Mamestra imbrifera Gueneé, Plate XXIII, Fig. 32, ♀.
(The Cloudy Mamestra.)
A native of the northern Atlantic States. It is not rare in New England.

(2) Mamestra purpurissata Grote, Plate XXIII, Fig. 26, ♂.
(The Empurpled Mamestra.)
This is a very common species in Maine and Quebec. It occurs less commonly south of these localities.

(3) Mamestra juncimacula Smith, Plate XIX, Fig. 41, ♂.
(The Fused-spot Mamestra.)
The habitat of this species is Colorado.

(4) Mamestra meditata Grote, Plate XXIII, Fig. 21, ♀.
(The Studied Mamestra.)
Quite a common species in the Appalachian Subregion.

(5) Mamestra lustralis Grote, Plate XXIII, Fig. 22, ♀.
(The Lustral Mamestra.)
Syn. suffusa Smith.
The range of this species is through the Atlantic States south and west to Arizona and northern Mexico.

(6) Mamestra detracta Walker, Plate XXIII, Fig. 24, ♂.
(The Disparaged Mamestra.)
Syn. claviplena Grote.
The range of this insect is the same as that of the last mentioned species.

(7) Mamestra farhani Grote, Plate XXIII, Fig. 23, ♀.
(Farnham's Mamestra.)
A native of the eastern portions of the region of the Rocky Mountains.

(8) Mamestra liquida Grote, Plate XXIII, Fig. 36, ♀. (The Liquid Mamestra.)
The range of this insect is in the northwestern part of our territory as far as British Columbia.
(9) *Mamestra radix* Walker, Plate XXIII, Fig. 25, ♂.  
(Dimmock's Mamestra.)

*Syn. dimmcki* Grote; *desperata* Smith.

Distributed from Maine and Quebec across the northern parts of the United States and the southern portions of the British possessions to the Pacific.

(10) *Mamestra nevadæ* Grote, Plate XXIII, Fig. 33, ♀.  
(The Nevadan Mamestra.)

Found in Nevada and California.

(11) *Mamestra subjuncta* Grote & Robinson, Plate XXIII, Fig. 27, ♂.  
(The Harnessed Mamestra.)

Not at all an uncommon species in the Appalachian Subregion, ranging across the Mississippi Valley to the foothills of the Rocky Mountains.

(12) *Mamestra grandis* Boisduval, Plate XXIII, Fig. 41, ♂.  
(The Grand Mamestra.)

*Syn. libera* Walker.

(13) *Mamestra trifolii* Rottemburg, Plate XXIII, Fig. 29, ♂.  
(The Clover Mamestra.)

*Syn. chenopodii* Fabricius; *albifusa* Walker; *glaucovaria* Walker; *major* Speyer.

Found throughout Europe, northern Asia, and the United States and Canada. The caterpillar does at times considerable damage to crops.

(14) *Mamestra rosea* Harvey, Plate XXIII, Fig. 30, ♀.  
(The Rosy Mamestra.)

Distributed generally through the northern portions of the United States and the southern portions of Canada and British Columbia.

(15) *Mamestra congermana* Morrison, Plate XXIII, Fig. 31, ♀.  
(The Cousin German.)

This insect ranges from the Atlantic to the eastern portions of the region of the Rocky Mountains.

(16) *Mamestra picta* Harris, Plate I, Fig. 11, larva; Plate XXIII, Fig. 34, ♂.  
(The Painted Mamestra.)

*Syn. exusta* Guenée; *contraria* Walker.

This is one of the commonest species of the genus. The caterpillar is a conspicuous object, and in the fall of the year is
Noctuidæ

generally very noticeable, feeding upon various herbaceous plants. It is a promiscuous feeder, and to enumerate all the vegetables which it attacks would almost be to provide a list of the plants of the United States. They manifest, however, a decided preference, when accessible, for the cruciferous plants, and do much damage in fields of cabbages and beets. There are two broods in the Middle States. The species does not occur on the Pacific coast, so far as is known to the writer. Its range is from the Atlantic to the eastern foothills of the Rocky Mountains.

(17) Mamestra lubens Grote, Plate XXIII, Fig. 28, ♂. (The Darling Mamestra.)

A denizen of the northern portions of the United States.

(18) Mamestra latex Guenée, Plate XXIII, Fig. 40, ♀. (The Fluid Mamestra.)

Syn. demissa Walker.

This insect has the same range as the preceding species.

(19) Mamestra adjuncta Boisduval, Plate XXIII, Fig. 38, ♀. (The Hitched Mamestra.)

This species occurs from southern Canada to the Carolinas and westward to Missouri and Minnesota.

(20) Mamestra rugosa Morrison, Plate XXIV, Fig. 3, ♂. (The Rugose Mamestra.)

The habitat of this species is Maine and Nova Scotia.

(21) Mamestra lilacina Harvey, Plate XXIII, Fig. 29, ♀. (The Lilacine Mamestra.)

Syn. illabefacta Morrison.
Explanation of Plate XXIII

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Cerapoda stylata Smith, ♂, U. S. N. M.
2. Eupides cinerea Smith, ♀, U. S. N. M.
4. Euxoa tessellata Harris, ♂.
5. Euxoa dissocia M'eschler, ♀.
7. Euxoa albipennis Grote, ♂.
8. Euxoa basalis Grote, ♂.
10. Euxoa ochrogaster Guenée, ♂.
11. Euxoa jurtius Smith, ♂.
12. Euxoa obeliscoideus Guenée, ♀.
13. Euxoa lutulenta Smith, ♂.
14. Richia ararix Harvey, ♂.
15. Richia parentalis Grote, ♂.
17. Anythus obscurus Smith, ♂.
18. Agrotaphila incognita Smith, ♂.
19. Ufjeus pictus Grote, ♂.
20. Ufjeus satyricus Grote, ♂.
22. Mamestra lustralis Grote, ♀.
23. Mamestra farnhami Grote, ♀.
25. Mamestra radix Walker, ♂.
26. Mamestra purpurissata Grote, ♂.
27. Mamestra subjuncta Grote & Robinson, ♂.
28. Mamestra lubens Grote, ♂.
29. Mamestra trifolii Rottemburg, ♂.
30. Mamestra rosca Harvey, ♀.
31. Mamestra congermana Morrison, ♀.
32. Mamestra imbrifera Guenée, ♀.
33. Mamestra nevadæ Grote, ♀.
34. Mamestra picta Harris, ♂.
35. Mamestra renigera Stephens, ♀.
36. Mamestra liquida Grote, ♀.
37. Mamestra olivaceo Morrison, ♂.
38. Mamestra adjuncta Boisduval, ♀.
39. Mamestra lilacinæa Harvey, ♂.
40. Mamestra latex Guenée, ♀.
41. Mamestra grandis Boisduval, ♂.
Noctuidae

This moth ranges from the Atlantic coast to Colorado and New Mexico.

(22) Mamestra renigera Stephens, Plate XXIII, Fig. 35, ♂ .
(The Kidney-spotted Mamestra.)
Syn. herbimacula Guenée; infecta Walker.
This prettily marked little moth is found from New England and Ontario to Colorado. It occurs also in Europe.

(23) Mamestra olivacea Morrison, Plate XXIII, Fig. 37, ♂ .
(The Olivaceous Mamestra.)
For the very extensive synonymy of this insect the reader is referred to Dr. Dyar's "Catalogue of the Moths of the United States." It is too lengthy to impose upon these pages. The moth ranges over the northern portions of the United States and southern Canada.

(24) Mamestra laudabilis Guenée, Plate XXIV, Fig. 1, ♂ .
(The Laudable Mamestra.)
Syn. indicans Walker; strigicollis Wallengren.
This species extends its range from New Jersey through the southern States to Texas and southern California and northern Mexico.

(25) Mamestra lorea Guenée, Plate XXIV, Fig. 2, ♂ . (The Bridled Mamestra.)
Syn. ligata Walker; dodgei Grote.
An obscurely colored species, which ranges from the Atlantic to the Rocky Mountains.

(26) Mamestra erecta Walker, Plate XXIV, Fig. 4, ♂ . (The Erect Mamestra.)
Syn. constipata Walker; innexa Grote.
This little moth occurs in Texas, Arizona, and northern Mexico.

(27) Mamestra anguina Grote, Plate XXIV, Fig. 5, ♂ . (The Snaky Mamestra.)
The insect occurs in the northern portions of our territory, and among the higher mountains of the States of Colorado and Wyoming.

(28) Mamestra vicina Grote, Plate XXIV, Fig. 6, ♂ . (The Allied Mamestra.)
Syn. teligera Morrison; acutipennis Grote.
Ranges from the Atlantic to the Pacific.
Noctuidae

(29) Mamestra neoterica Smith, Plate XXIV, Fig. 7, ♂. (The Modern Mamestra.)

The range of this species is from Manitoba to Alberta, so far as is at present known.

(30) Mamestra negussa Smith, Plate XXIV, Fig. 8, ♀. (The Brown-winged Mamestra.)

The species was originally described from Alberta. It occurs also in northern Montana.

Genus ADMETOVIS. Grote

(1) Admetovis oxymorus Grote, Plate XXIV, Fig. 9, ♂.

This insect which is one of two species, which are attributed to the genus, is found from Colorado to California.

Genus BARATHRA Hübner

(1) Barathra occidentata Grote, Plate XXIV, Fig. 10, ♀.

This is a New Mexican species. Another species of the genus, named curialis by Smith, has been described by him as coming from Maine and New Hampshire.

Genus NEURONIA Hübner

(1) Neuronia americana Smith, Plate XXIV, Fig. 12, ♂. (The American Neuronia.)

This is the only species of the genus represented in our territory. It occurs in Montana and Alberta.

Genus DARGIDA Walker

The only species of this genus found within the limits of the United States was named procinctus by Grote. It is represented by the figure of the male insect on Plate XXIV, Fig. 11. It is found from Colorado to California and Oregon.

Genus MORRISONIA Grote

Six species are attributed to this genus. We figure two of them.

(1) Morrisonia sectilis Guenée, Plate XXIV, Fig. 13, ♂.

Syn. evicta Grote.

Form vomerina Grote, Plate XXIV, Fig. 14, ♀.
The home of this insect is the Northern Atlantic States. It occurs in both forms in western Pennsylvania and Indiana.

(2) **Morrisonia confusa** Hübnner, Plate XXIV, Fig. 15, ♂.
Syn. *infrauctuosa* Walker; *multifaria* Walker.
Not uncommon in the Atlantic Subregion.

**Genus XYLOMIGES** Guenée

In our fauna are found fifteen species which have been assigned to this genus. From their number we have chosen seven to put before the students of this book.

(1) **Xylomiges simplex** Walker, Plate XXIV, Fig. 17, ♂.
(The Simple Woodling.)
Syn. *crucialis* Harvey.
A well marked and easily recognizable species, recalling the genus *Apatela*, so far as the pattern of the maculation is concerned. It is spread from Colorado westward to California.

(2) **Xylomiges dolosa** Grote, Plate XXIV, Fig. 20, ♂. (The Grieving Woodling.)
Distributed over the northern Atlantic States, and westward to Colorado.

(3) **Xylomiges perlubens** Grote, Plate XXIV, Fig. 19, ♂.
(The Brown Woodling.)
Syn. *subapicalis* Smith.
This species belongs to the fauna of the Pacific coast, ranging eastward to Colorado.

(4) **Xylomiges pulchella** Smith, Plate XXIV, Fig. 21, ♂.
(The Beautiful Woodling.)
Habitat British Columbia.

(5) **Xylomiges patalis** Grote, Plate XXIV, Fig. 18, ♀.
(Fletcher’s Woodling.)
Syn. *fletcheri* Grote.
Found in the Pacific States.

(6) **Xylomiges cognata** Smith, Plate XXIV, Fig. 22, ♂.
(The Oregon Woodling.)
Ranges from British Columbia and Oregon eastward to Colorado.

(7) **Xylomiges indurata** Smith, Plate XXIV, Fig. 23, ♂.
(The Hardened Woodling.)
Noctuidae

Readily distinguished from *X. dolosa* by the lighter color of the primaries and the pure white secondaries, as well as by the different maculation. It is found in Colorado.

Genus SCOTOGRAMMA Smith

Of the thirteen species belonging to this genus and occurring in our fauna we depict three.

1) *Scotogramma submarina* Grote, Plate XXIV, Fig. 24, δ.
A native of the region of the Rocky Mountains ranging from Arizona to Montana.

2) *Scotogramma infuscata* Smith, Plate XXIV, Fig. 25, δ.
The figure given on the plate is taken from a specimen in the United States National Museum. The insect is found in Colorado.

3) *Scotogramma inconcinna* Smith, Plate XXIV, Fig. 26, δ.
This plainly colored species, like its predecessor, occurs in Colorado.

Genus ULOOLONCHE Smith

A genus of moderate extent, all of the species belonging to which are western, except the one we figure, which occurs in the Atlantic Subregion.

1) *Ulolonche modesta* Morrison, Plate XXIV, Fig. 16, δ.
The species is not common.

Genus ANARTA Ochsenheimer

A subarctic genus, represented in both hemispheres. The insects occur either in high northern latitudes, or at great elevations upon high mountains. There are many species. We give illustrations of five of those found in our fauna.

1) *Anarta cordigera* Thunberg, Plate XXIV, Fig. 28, δ.
(The Catocaline Anarta.)
Found in northern Canada, Labrador, Alaska, and thence southward along the summits of the higher ranges of the Rocky Mountains to Colorado. It also occurs in the north of Scotland, and from Norway to Kamschatka.

2) *Anarta melanopa* Thunberg, Plate XXIV, Fig. 27, δ.
(The Black-mooned Anarta.)
Syn. *nigrolunata* Packard.
A circumpolar species commonly found in both hemispheres.

(3) Anarta schoenherri Zetterstedt, Plate XXIV, Fig. 30, ♂
(Schoenherr’s Anarta.)

Syn. leuocycla Staudinger.

Its habitat is Labrador, Greenland, Norway, Lapland, and arctic Asia.

(4) Anarta richardsoni Curtis, Plate XXIV, Fig. 29, ♀
(Richardson’s Anarta.)

Ranges from Alaska to Labrador, and has been found on the mountains of Norway.

(5) Anarta impingens Walker, Plate XXIV, Fig. 31, ♂
(The Dull Brown Anarta.)

Syn. nivaria Grote; curta Morrison; perpura Morrison.

Found on the mountains of Colorado.

Genus TRICHOCLEA Grote

A small genus confined in its range to the mountain regions of the West.

(1) Trichoclea antica Smith, Plate XXIV, Fig. 32, ♂

The specimen figured is one kindly loaned me from the national collection, and determined by the author of the species.

Genus TRICHOPOLIA Grote

Of this small genus we are able to give a figure of the type of the species named serrata by Professor Smith. The moth occurs in Texas.

Genus EUPOLIA Smith

Only one species has thus far been referred to this genus. It was named licentiosa by Prof. J. B. Smith. The annexed cut gives a figure of the type, which is preserved in the United States National Museum. Its home is Utah.

Genus NEPHELODES Guenée

(1) Nephelodes minians Guenée, Plate XXIV, Fig. 33, ♂

Syn. expansa Walker; sobria Walker; violans Guenée; subdolens Walker
Noctuidae

A common species in the Atlantic States. It is abundant in the fall of the year in western Pennsylvania.

Genus HELIOPHILA Hübner

A large genus well represented in both the eastern and the western hemispheres. Thirty-six species are credited to our fauna. Of these we give figures of eight, selecting the commoner and a few of the rarer forms.

(1) Heliophila unipuncta Haworth, Plate XXIV, Fig. 40, @.
(The Army Worm.)

Syn. extranea Guenée.

This species, the larva of which is known as the "Northern Army Worm," or simply as the "Army Worm," is found from the Atlantic to the Rocky Mountains, and from Canada to Texas and southward at suitable elevations upon the higher plateaus of northern Mexico. It appears occasionally in vast numbers, and is regarded by the farmer and the horticulturist as one of those pests against the ravages of which they must direct a great deal of energy. The first appearance of these insects in great numbers is recorded as having occurred in New Hampshire and Massachusetts in the year 1743. In the year 1770 they devastated the fertile fields of the valley of the Connecticut. They devoured the grasses and cereals, but neglected the pumpkins and potatoes. The chronicler of this invasion says: "Had it not been for pumpkins, which were exceedingly abundant, and potatoes, the people would have greatly suffered for food. As it was, great privation was felt on account of the loss of grass and grain." Successive attacks of the insect have been made since then upon the crops in various parts of the country. The year 1861 is memorable as having been marked by their ravages, which were particularly noticeable in the State of Missouri and in southern Illinois. An excellent account of this invasion has been published.
by Prof. C. V. Riley in his "Second Annual Report" as State Entomologist of Missouri. It appears from the investigations of those who are familiar with the habits of the insect that they appear in greatest numbers in years which are characterized by being wet and cool, following years in which there has been drought. Such conditions seem to be favorable to the development of the insects in great swarms. Their appearance in the fields is often at first not observed; but when, having attained considerable size, the supply of grain and grasses gives out, and they begin to migrate in vast bodies in search of provender, they at once attract attention.

The best remedy for these pests is to burn over grass lands in the winter, to keep the fence-rows clear of grass and weeds, and to plough under the land in the spring or the fall. Untilled grass lands on which crops are not properly rotated become centres of infection.

(2) Heliophila pseudargyria Guenée, Plate XXIV, Fig. 47, ♂. (The False Wainscot.)
A common species in the Atlantic States, freely attracted to sugar.

(3) Heliophila subpunctata Harvey, Plate XXIV, Fig. 35, ♂. (The Dark-winged Wainscot)
Syn. complicata Strecker.
The range of this species is from New Mexico and Texas to Arizona.

(4) Heliophila minorata Smith, Plate XXIV, Fig. 41, ♀. (The Lesser Wainscot.)
This species is found in California and Oregon.

(5) Heliophila albilinea Hübner, Plate XXIV, Fig. 34, ♂. (The White-lined Wainscot.)
Syn. harveyi Grote.
The insect is widely distributed, ranging from Nova Scotia to New Mexico and Texas, but apparently avoiding the Great Plains and the regions lying west of them.
It is a very common species in the Atlantic States, and at times does considerable injury to the crops. It has never, however, equaled in destructiveness the first species of the genus, to which we have given our attention on the preceding pages. It is said to be particularly attracted to the wheat when the grain is in the milk and the heads are just maturing. The damage done at this time is, in the Middle States, where winter wheat is commonly grown, due to the first generation of the insects. There are in fact two broods, one appearing on the wing in spring or early summer, the second in the late summer. The latter brood, which generally is more numerous than the first, produces the caterpillars, the pupae of which yield the moths, which, coming out in the spring of the year, lay their eggs in the wheatfields. It is said that the habit of attacking wheat in its period of maturation has lately been acquired by this insect, and is an illustration of the way in which species, long regarded as innocuous, develop with apparent suddenness destructive tendencies.

(6) Heliophila heterodoxa, Smith, Plate XXIV, Fig. 36, ε. (The Heterodox Wainscot.)

The insect ranges from British Columbia and northern California as far east as Minnesota.

(7) Heliophila multilinea Walker, Plate XXIV, Fig. 39, ε. (The Many-lined Wainscot.)

Syn. lapidaria Grote.

Not a scarce species in the Atlantic States.
(8) Heliophila commoides Guèneé, Plate XXIV, Fig. 42, ♂.
(The Comma Wainscot.)
The insect occurs from the Atlantic westward as far as Colorado. It is not very common.

Genus NELEUCANIA Smith

This is a small genus composed of species, which are, so far as is known, exclusively Western.

(1) Neleucania bicolorata Grote. (The Two-colored Neleucania.)

Of this species, which occurs in Colorado, New Mexico and Arizona, and probably has a still wider distribution, we are able to give a figure based upon a specimen contained in the United States National Museum.

Genus ZOSTEROPODA Grote

Only one species of this genus is known at present.

(1) Zosteropoda hirtipes Grote, Plate XXIV, Fig. 46, ♂.
The insect occurs in California.

Genus ORTHODES Guèneé

Of the ten species reputed to belong to the genus and said to be found in our territory four are figured.

(1) Orthodes crenulata Butler, Plate XXIV, Fig. 37, ♂.
(The Rustic Quaker.)
An exceedingly common species in the Atlantic States, ranging westward throughout the valley of the Mississippi.

(2) Orthodes cynica Guèneé, Plate XXIV, Fig. 38, ♂. (The Cynical Quaker.)
Syn. candens Guèneé; tecta Walker.
Quite as common as the preceding species, and having the same range.

(3) Orthodes vecors Guèneé, Plate XIX, Fig. 20, ♂. (The Small Brown Quaker.)
Syn. enervis Guèneé; nimia Guèneé; togata Walker; velata Walker; prodeuns Walker; griseocincta Harvey; nitens Grote.
Noctuidae

This is another small creature, which has caused the species-makers much exercise. It is found very generally throughout the Atlantic States.

(4) Orthodes puerilis Grote, Plate XXIV, Fig. 45, δ. (The Boyish Quaker.)
This insect is found in northern California.

Genus HIMELLA Grote

(1) Himella contrahens Walker, Plate XXIV, Fig. 44, ♀. Syn. thecata Morrison.
This insect is found from the northern Atlantic States southward and westward to New Mexico and Colorado.

Genus CROCIGRAPHA Grote

(1) Crociographa normani Grote, Plate XXIV, Fig. 43, δ.
Not an uncommon insect in the northern portions of the Atlantic Subregion.

Genus GRAPHIPHORA Hübner

This is an extensive genus, represented in both hemispheres, and containing thirty-six species, which occur within our territory. We illustrate four of them.

(1) Graphiphora culea Guenée, Plate XXV Fig. 1, ♀. Syn. modifica Morrison.
This species is quite common in the Appalachian or Atlantic Subregion.

(2) Graphiphora oviduca Guenée, Plate XXV, Fig. 2, δ. Syn. capsella Grote; orobia Harvey.
The insect has the same range as the preceding species, and is equally common.

(3) Graphiphora alia Guenée, Plate XXV, Fig. 3, ♀. Syn. instabilis Fitch; insciens Walker; hibisci Guenée; confluens Morrison.
Not a scarce species in the Atlantic Subregion.

(4) Graphiphora garmani Grote, Plate XXV, Fig. 5, δ.
A rather scarce insect ranging from western Pennsylvania throughout the valley of the Mississippi as far as Illinois and Iowa.

204
Explanation of Plate XXIV

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Mamestra laudabilis Guenée, ♂.
3. Mamestra rugosa Morrison, ♂.
5. Mamestra anguina Grote, ♀.
6. Mamestra vicina Grote, ♀.
7. Mamestra neoterica Smith, ♂.
8. Mamestra negussa Smith, ♀.
11. Dargida procinctus Grote, ♂.
14. Morrisonia sectilis var. vomerina, Grote, ♀.
15. Morrisonia confusa Hübner, ♂.
17. Xylomiges simplex Walker, ♂.
18. Xylomiges patalis Grote, ♀.
19. Xylomiges perlubens Grote, ♂.
20. Xylomiges dolosa Grote, ♂.
22. Xylomiges cognata Smith, ♂.
23. Xylomiges indurata Smith, ♂.
25. Scotogramma injuscata Smith, ♀, U. S. N. M.
26. Scotogramma inconcinna Smith, ♀, U. S. N. M.
27. Anaria melanopa Thunberg, ♂.
28. Anaria cordigera Thunberg, ♂.
29. Anaria richardsoni Curtis, ♀.
30. Anaria schenherri Zetterstedt, ♀.
31. Anaria impingens Walker, ♀.
32. Trichoclea antica Smith, ♀, U. S. N. M.
33. Ncphelodes minians Guenée, ♀.
34. Heliophila albilinea Hiibner, ♀.
35. Heliophila subpunctata Harvey, ♀.
36. Heliophila heterodoxa Smith, ♀.
37. Orthodes crenulata Butler, ♂.
38. Orthodes cynica Guenée, ♂.
40. Heliophila unipuncta Haworth, ♂.
41. Heliophila minorata Smith, ♂.
42. Heliophila commoides Guenée, ♂.
43. Crocigrapha normani Grote, ♂.
44. Himella contrahens Walker, ♀.
45. Orthodes puerilis Grote, ♂.
46. Zosteropoda hirtipes Grote, ♂, U. S. N. M.
47. Heliophila pseudargyria Guenée, ♀.
Genus **STRETCHIA** Henry Edwards

This is an extensive genus, to which a number of Western species have been referred. It badly needs revision by a critical authority. We figure one of the best known forms.

(1) **Stretchia muricina**, Plate XXV, Fig. 5, ♂ .

In addition to the figure given on the plate we annex a cut made from a drawing of a specimen contained in the collection of the late Henry Edwards, and now in the possession of the American Museum of Natural History in New York.

Genus **PERIGONICA** Smith

This is a small genus, which we represent by a figure of the Coloradan insect to which Prof. J. B. Smith has applied the specific name _fulminans_. The male is depicted on Plate XXV, Fig. 6.

Genus **PERIGRAPHA** Lederer

The only species of this genus found in our fauna has been named _prima_ by Professor Smith. It is represented by a drawing of the type, which is contained in the American Museum of Natural History. The insect is a native of California.

Genus **TRICHOLITA** Grote

(1) **Tricholita signata** Walker, Plate XXV, Fig. 7, ♂ .

*Syn. semiaperta* Morrison.

This is the only species of the genus found in the eastern portion of the United States. There are four other species, but they are western in their habitat.

Genus **CLEOSIRIS** Boisduval

This is a small genus found in Europe as well as in America. The species which has been chosen to represent the genus was named _populi_ by Strecker, who first described it. It is not at all uncommon in Colorado and Wyoming. It
Noctuidæ

occurs abundantly about the city of Laramie. It is represented upon Plate XXV, Fig. 8, by a female specimen.

Genus Pleroma Smith

(1) Pleroma obliquata Smith, Plate XXV, Fig. 11, ♂.
The species of this genus are all found in the western half of our territory.

Genus Lithomoia Hübner

(1) Lithomoia germana Morrison, Plate XXV, Fig. 12, ♀.
This is not at all an uncommon species in the northern Atlantic States.

Genus Xylina Ochsenheimer

An extensive genus found both in the New World and the Old. Thirty-five species are attributed to it as found in our fauna. Of this number ten are depicted in this book.
(1) Xylina disposita Morrison, Plate XXV, Fig. 13, ♀. (The Green-gray Pinion.)
The moth is found in the northern Atlantic States.
(2) Xylina petulca Grote, Plate XXV, Fig. 9, ♀. (The Wanton Pinion.)
Not a common species, having the same range as the preceding.
(3) Xylina antennata Walker. (The Ashen Pinion.)
Syn. cinerea Riley.
The moth is a native of the Atlantic States. The larva feeds upon the apple, poplar, hickory, and other deciduous trees. It has the habit of boring into apples and peaches, and the galls which are found upon oaks. The caterpillar is green, marked with a cream-colored lateral stripe, and spots of the same color. It pupates beneath the soil in a loose, filmy cocoon of silk, to which the particles of earth are adherent. Pupation takes place at the end of June, or the
beginning of July, and the moth emerges in September and October.

(4) *Xylina laticinerea* Grote, Plate XXV, Fig. 17, ♂. (The Broad Ashen Pinion.)
The distribution of this species is the same as that of the last mentioned.

(5) *Xylina innominata* Smith, Plate XXV, Fig. 10, ♂. (The Nameless Pinion.)
The range of the Nameless Pinion is from the Atlantic to Colorado.

(6) *Xylina unimoda* Lintner, Plate XXV, Fig. 16, ♂. (The Dowdy Pinion.)
The species occurs in New England and the Middle States.

(7) *Xylina tepida* Grote, Plate XXV, Fig. 15, ♂. (The Warm Gray Pinion.)
An eastern species, not uncommon in Pennsylvania.

(8) *Xylina baileyi* Grote, Plate XXV, Fig. 19, ♀. (Bailey's Pinion.)
A rather pretty species, which has thus far only been reported from northern New York.

(9) *Xylina thaxteri* Grote, Plate XXV, Fig. 18, ♀. (Thaxter's Pinion.)
The home of this species is New England. It was originally described from Maine.

(10) *Xylina pexata* Grote, Plate XXV, Fig. 20, ♀. (The Nappy Pinion.)
Syn. *washingtoniana* Grote.
The species ranges from New England to Washington and Oregon.

**Genus LITHOLOMIA Grote**

There are only two species reckoned in this genus. The one, which we figure on Plate XXV, Fig. 22, by a male specimen, ranges over the entire northern portion of the United States from ocean to ocean, but is nowhere very common. The other species, *L. dunbari* Harvey, is only known from British Columbia.

**Genus CALOCAMPA Stephens**
The genus is found in both hemispheres. The species have a habitus which enables them to be easily recognized.
Noctuidae

six occurring within the faunal limits, with which this book deals, we illustrate two.

(1) Calocampa nupera Lintner, Plate XXV, Fig. 24, ♂. (The American Swordgrass.)

A rather large moth, easily distinguished from the following species by the absence of the dark markings, which are found in the disk of the primaries of the latter insect. It occurs in the Atlantic Subregion.

(2) Calocampa curvimacula Morrison, Plate XXV, Fig. 23, ♂. (The Dot and Dash Swordgrass.)

The species is found throughout the northern portions of the United States and also in Canada.

Genus CUCULLIA Schrank

This is a considerable genus, which occurs in the temperate regions of both the Old World and the New. Four of the fourteen species attributed to our territory are chosen for representation. The larvae feed on Solidago and other Compositae.

(1) Cucullia convexipennis Grote & Robinson, Plate I, Fig. 3, larva; Plate XXV, Fig. 29, ♂. (The Brown-bordered Cucullia.)

A native of the Atlantic States.

(2) Cucullia asteroides Guenée, Plate XXV, Fig. 27, ♀. (The Asteroid.)

Found in the same localities as the last named species.

(3) Cucullia speyeri Lintner, Plate XXV, Fig. 26, ♂. (Speyer's Cucullia.)

Ranges through Colorado, Wyoming, and the adjacent regions to the west.

(4) Cucullia intermedia Speyer, Plate XXV, Fig. 30, ♀. (The Intermediate Cucullia.)

An Atlantic species.

Genus COPICUCULLIA Smith

(1) Copicucullia propinqua Smith, Plate XXV, Fig. 28, ♀. A native of Colorado and Wyoming
Genus RANCORA Smith

(1) Rancora solidaginis Behr, Plate XXV, Fig. 25, ♂.
Syn. strigata Smith.
The range of this insect is from northern California to British Columbia.

Genus LATHOSEA Grote

(1) Lathosea pullata Grote, Plate XXV, Fig. 32, ♂.
The species occurs in Oregon and eastward to Colorado.
(2) Lathosea ursina Smith, Plate XXV, Fig. 31, ♀.
A native of Colorado and the southern portions of Wyoming.

Genus ASTEROSCOPUS Boisduval

We are able to give a cut of the sole species which has been assigned from our fauna to this genus. It is based upon the type of the species which was named borealis by Smith, and which is preserved in the United States National Museum at Washington. The insect is a male.

TRAGEDY OF THE NIGHT-MOTH

Magna ausus

'Tis placid midnight, stars are keeping
Their meek and silent course in heaven;
Save pale recluse, for knowledge seeking,
All mortal things to sleep are given.

But see! a wandering Night-moth enters,
Allured by taper gleaming bright;
Awhile keeps hovering round, then ventures
On Goethe's mystic page to light.

With awe she views the candle blazing;
A universe of fire it seems
To moth-savante with rapture gazing,
Or Fount whence Life and Motion streams.

What passions in her small heart whirling,
Hopes boundless, adoration, dread;
At length her tiny pinions twirling,
She darts, and—puff!—the moth is dead.
Tragedy of the Night-Moth

The sullen flame, for her scarce sparkling,
Gives but one hiss, one fitful glare;
Now bright and busy, now all darkling,
She snaps and fades to empty air.

Her bright gray form that spread so slimly,
Some fan she seemed of pygmy Queen;
Her silky cloak that lay so trimly,
Her wee, wee eyes that looked so keen.

Last moment here, now gone forever,
To nought are passed with fiery pain;
And ages circling round shall never
Give to this creature shape again!

Poor moth! near weeping I lament thee,
Thy glossy form, thy instant woe;
'Twas zeal for "things too high" that sent thee
From cheery earth to shades below.

Short speck of boundless Space was needed
For home, for kingdom, world to thee!
Where passed unheeding as unheeded
Thy little life from sorrow free.

But syren hopes from out thy dwelling
Enticed thee, bade thee earth explore—
Thy frame, so late with rapture swelling,
Is swept from earth forevermore!

Poor moth! thy fate my own resembles.
Me, too, a restless, asking mind
Hath sent on far and weary rambles,
To seek the good I ne'er shall find.

Like thee, with common lot contented,
With humble joys and vulgar fate,
I might have lived and ne'er lamented,
Moth of a larger size, a longer date!

But Nature's majesty unveiling
What seemed her wildest, grandest charms,
Eternal Truth and Beauty hailing,
Like thee, I rushed into her arms.

What gained we, little moth? Thy ashes,
Thy one brief parting pang may show:
And thoughts like these, for soul that dashes
From deep to deep, are—death more slow!

Thomas Carlyle.
EXPLANATION OF PLATE XXV

(Except when otherwise indicated, the specimens figured are in the collection of W. J. Holland.)

1. Graphiphora culea Guenée, ♀.
2. Graphiphora ovicula Guenée, ♂.
4. Graphiphora garmani Grote, ♂, Merrick Collection.
5. Stretchia muricina Grote, ♂.
6. Perigonica fulminans Smith, ♂.
8. Cleosirus populi Strecker, ♀, U. S. N. M.
9. Xylena petulca Grote, ♂.
10. Xylena innominata Smith, ♂.
11. Pleroma obliquata Smith, ♂, U. S. N. M.
12. Lithomia germana Morrison, ♀.
13. Xylena disposita Morrison, ♀.
14. Homoglea carbonaria Harvey, ♀.
15. Xylena tepida Grote, ♂.
16. Xylena unimoda Lintner, ♂.
17. Xylena laticinerea Lintner, ♂.
18. Xylena thaxteri Grote, ♀.
19. Xylena baileyi Grote, ♀.
20. Xylena pexata Grote, ♀.
22. Litholomia napea Morrison, ♂.
23. Calocampa curvimalcula Morrison, ♂.
25. Rancora solidaginis Behr, ♀.
27. Cucullia asteroides Guenée, ♂.
28. Copicucullia propinqua Smith, ♀.
30. Cucullia intermedia Speyer, ♀.
31. Lathosea ursina Smith, ♀, U. S. N. M.
32. Lathosea pullata Grote, ♂, U. S. N. M.
33. Nonagria oblonga Grote, ♂, U. S. N. M.
34. Nonagria subflava Grote, ♀.
35. Onmatostola lintneri Grote, ♂, U. S. N. M.
36. Sphida obliqua Walker, ♀.
Genus BELLURA Walker

We cause this genus to be represented by a figure of the species named gortynides by Walker. Synonyms are dena Walker, vulnifica Grote, melanopyga Grote. The insect is peculiar to the Atlantic States, so far as is known. The cut was drawn from a specimen in the American Museum of Natural History in New York.

![Illustration of B. gortynides]

Fig. 119.—*Bellura gortynides*. ♂. ♀.

Genus SPHIDA Grote

(1) Sphida obliqua Walker, Plate XXV, Fig. 36, ♀.  
Syn. obliquata Grote & Robinson.

The range of this moth is from the Atlantic to the Mississippi. The specimen figured was taken by the writer at light in Minneapolis. It feeds in the stems of *Typha latifolia*.

Genus NONAGRIA Ochsenheimer

A rather small genus of obscurely colored moths, the larvae of which burrow in the stems of aquatic plants, below the waterline. The genus is represented in both hemispheres. Six species belong to our fauna.

(1) Nonagria oblonga Grote, Plate XXV, Fig. 33, ♂. (The Large Nonagria.)  
Syn. permagna Grote.

This is a Southern species, thus far only recorded as found in Florida.

(2) Nonagria subflava Grote, Plate XXV, Fig. 34, ♀. (The Yellowish Nonagria.)  
The insect ranges from Maine to Illinois, where it is found in the vicinity of lakes and pools of water in which rushes grow.

Genus OMMATOSTOLA Grote

(1) Ommatostolalintneri Grote, Plate XXV, Fig. 35 ♂.  
Thus far this species has only been recorded from New York and New Jersey.

211
Noctuidæ

Genus ACHATODES Guenée

(1) Achatodes zeæ Harris, Plate I, Fig. 12, larva; Plate XXVI, Fig. 1, ♂.

This common insect, like those of the next three genera, is a stem-feeder, burrowing in the pith of its food-plants. It feeds in stems of elder (Sambucus), and Indian corn.

Genus GORTYNA Ochsenheimer

This genus is represented in the faunæ of both hemispheres. It is quite extensive.

(1) Gortyna velata Walker, Plate XXVI, Fig. 3, ♂. (The Veiled Gortyna.)

Syn. sera Grote & Robinson.

Not uncommon in the Atlantic States.

(2) Gortyna nictitans Borkhausen, Plate XXVI, Fig. 2, ♂.

This species, which is also found in Europe, has an extensive synonymy. It is found from the Atlantic to the Pacific, and shows in different localities slight differences in ground-color and markings, which have led to the creation of a number of subspecific distinctions by writers.

(3) Gortyna immanis Guenée, Plate XXVI, Fig. 4, ♀. (The Hop-vine Gortyna.)

The insect is not often found south of New York and New England to any great extent, though its occurrence as far south as Maryland as a rarity has been noted. From western New York it ranges across the continent to the Pacific. As it particularly infests the hop it will not be abundant in places where that plant is not grown. In the centre of the hop-growing region of
New York and Ontario it is very abundant at times, and its depredations have been complained about by those interested in this industry. The eggs are laid on the young shoots and the little larvæ immediately bore into the stem near the tip. Here they remain until they are half an inch long, when they descend and attack the plant at the level of the ground. It has been recommended to pinch the tips which are seen to be affected and thus to kill the young worms. Various applications to be put about the roots have been advocated, for which the reader may consult "Bulletin No. 7 (New Series) of the United States Department of Agriculture." The hop-vines should at all events not be hilled up until the end of July or the beginning of August. This prevents the larvæ from having easy access to the stems at the level of the ground.

(4) **Gortyna obliqua** Harvey, Plate XXVI, Fig. 13, \( \delta \). (The Oblique Gortyna.)

The habitat of this species is the Atlantic States and the Mississippi Valley.

**Genus PAPAIPEMA Smith**

(1) **Papaipema inquæsita** Grote & Robinson, Plate XXVI, Fig. 5, \( \delta \).

This species is, so far as we know, confined to the northern Atlantic States.

(2) **Papaipema purpurifascia** Grote & Robinson, Plate XXVI, Fig. 7, \( \delta \).

The range of this, as well as of all the species subsequently mentioned, is the same as that of the first species named in the genus.

(3) **Papaipema nitela** Guenee, Plate XXVI, Fig. 9, \( \delta \). Form nebris Guenee, Plate XXVI, Fig. 8, \( \delta \).

The caterpillar inflicts a good deal of damage upon Indian corn by burrowing into the end of the ear when the seed is in the milk. Those who have had to do with the preparation of roasting ears well know the unsightly larvæ, which, as they have stripped the husk from the cob, have revealed their presence. Cooks know more about these things than the farmer. The farmer...
Noctuidæ

pulls his corn after the seed is hard and dry, but the "kitchen mechanic," who has to deal with green vegetables, often has light upon subjects which elude the observation of the grower.

(4) Papaipema necopina Grote, Plate XXVI, Fig. 12, ♀.
The species occurs in the Middle States, and has been more frequently found in New York than elsewhere.

(5) Papaipema cerussata Grote & Robinson, Plate XXVI, Fig. 10, ♀.
A pretty species, which occurs in New England and the Northern States as far west as Minnesota.

(6) Papaipema cataphracta Grote, Plate XXVI, Fig. 6, ♂.
The species is found in the northern Atlantic States, and is not unusual in western Pennsylvania.

(7) Papaipema marginidens Guenée, Plate XXVI, Fig. 11, ♂.
A rather scarce species, which has the same range as the preceding.

(8) Papaipema furcata Smith, Plate XXVI, Fig. 14, ♀.
The specimen shown on the plate was taken in western Pennsylvania.

Genus OCHRIA Hübner

Dr. Dyar in his recent list refers to this genus the insect which was accorded the specific name sauzælitæ by Grote. We give a figure of the moth taken from a specimen in the American Museum of Natural History, for the skilful delineation of which we are indebted to the facile fingers of Mrs. William Beutenmuller, one of the most accomplished delineators of insect life in America.

Genus PYRRHIA Hübner

(1) Pyrrhia umbra Hufnagel, Plate XXVI, Fig. 15, ♀.
This species, which occurs in Europe, ranges in North America from the Atlantic to the Rocky Mountains.

Genus XANTHIA Hübner

(1) Xanthia flavago Fabricius, Plate XXVI, Fig. 16, ♂.
Syn. togata Esper; silago Hübner.
This is likewise a European species, which has a wide range in the northern parts of the United States.

**Genus JODIA Hübner**

(1) *Jodia rufago* Hübner, Plate XXVI, Fig. 17, ♂. (The Red-winged Sallow.)  
*Syn. honesta* Walker.  
A European as well as a North American species.

**Genus BROTOLOMIA Lederer**

(1) *Brotolomia iris* Guenée, Plate XXVI, Fig. 19, ♀.  
Not a very common moth, which occurs from New England to Colorado.

**Genus TRIGONOPHORA Hübner**

(1) *Trigonophora periculosa* Guenée, var. *v-brunneum* Grote, Plate XXVI, Fig. 18, ♂.  
This is a very common species, having the same range as the preceding. The form we figure has the V mark on the wings heavy and dark. In the typical form this mark is light in color.

**Genus CONSERVULA Grote**

(1) *Conservula anodonta* Guenée, Plate XXVI, Fig. 20, ♀.  
A rather scarce species, which is found in the northern part of our territory, south of Canada, and east of the Mississippi.

**Genus EUCIRROEDIA Grote**

(1) *Eucirroedia pampina* Guenée, Plate XXVI, Fig. 21, ♀.  
The moth comes out late in the fall. I have often found them when a warm day has occurred in the autumn, freshly emerged, and hanging from the stems of bushes from which all the leaves had already fallen. The insect is common in the Appalachian subregion.

**Genus SCOLIOPTERYX Germar**

(1) *Scoliopteryx libatrix* Linnaeus, Plate XXVI, Fig. 22, ♂. (The Herald.)  
A common insect found in Europe and the entire temperate zone in North America. The larva feeds on willows.
Noctuidæ

Genus CHŒPHORA Grote & Robinson

(1) Chœphora fungorum Grote & Robinson, Plate XXVI, Fig. 23, ♀.
Not a very common moth. It is found among the Alleghanies in western Pennsylvania, and also occurs in other portions of the northern Atlantic subregion.

Genus PSEUDORTHOSIA Grote

The only species of the genus was named variabilis by Grote. It ranges from California to Colorado. We give a figure of the species drawn by Mrs. Beutenmüller from a specimen contained in the collection of the late Henry Edwards, and now in the American Museum of Natural History.

Genus PSEUDOGLÆA Grote

(1) Pseudoglæa blandæ Grote, Plate XXVI, Fig. 24, ♂.
Syn. tædata Grote; deceptæ Grote.
The habitat of the species is the Pacific States from which it ranges eastward to Texas and Colorado.

Genus ANCHOCELIS Guenée

(1) Anchocelis digitalis Grote, Plate XXVI, Fig. 25, ♂.
The only species in our fauna so far known is found in the northern Atlantic States.

Genus SELICANIS Smith

Under this generic name Prof. J. B. Smith in 1900 described a species from Colorado to which he gave the specific name cinereola. The type of this insect, which is preserved in the United States National Museum, is represented in the accompanying cut.

Genus TAPINOSTOLA Lederer

(1) Tapinostola variana Morrison, Plate XXVI, Fig. 26, ♂.
The figure we give is taken from a specimen belonging to the United States National Museum and coming from Michigan.

216
Genus FAGITANA Walker

Two species, which were formerly attributed to the genus *Pseudolimacodes* Grote, occur in the United States. We figure both of them.

(1) *Fagitana obliqua* Smith, Plate XXVI, Fig. 27, ♂. The habitat of this species is Florida.

(2) *Fagitana littera* Guenée, Plate XXVI, Fig. 28, ♀. Syn. *lucidata* Walker; *niveicostatus* Grote. This is a rare insect, which occurs in the Atlantic States.

Genus COSMIA Ochsenheimer

(1) *Cosmia paleacea* Esper, Plate XXVI, Fig. 32, ♂. (The Angle-striped Sallow.) Syn. *discolor* Walker; *infumata* Grote. This insect is found all over northern Europe and the United States.

Genus ORTHOSIA Ochsenheimer

The genus is well represented both in the New World and the Old. Of the fifteen species reckoned as belonging to our fauna two are selected for illustration.

(1) *Orthosia bicolorago* Guenée, Plate XXVI, Fig. 29, ♂. An eastern species, which is not uncommon.

(2) *Orthosia helva* Grote, Plate XXVI, Fig. 30, ♀. A very common species in the Atlantic States, ranging westward as far as Colorado.

Genus PARASTICHTIS Hübner

(1) *Parastichtis discivaria* Walker, Plate XXVI, Fig. 31, ♂. Syn. *gentilis* Grote. Found throughout the northern Atlantic States.

Genus SCOPELOSOMA Curtis

This genus represented in Europe by a single species is represented in the United States and Canada by half a score of species. They appear upon the wing very early in the spring, when the nights are still cool and even frosty. This fact is the reason why they are for the most part not well represented in
collections. A good place to collect them is in maple-sugar camps, about the sap-buckets.

(1) **Scopelosoma moffatiana** Grote, Plate XXVI, Fig. 33, ♂. (Moffat’s Sallow.)

This as well as all of the other species is found in the northern portion of the Atlantic subregion.

(2) **Scopelosoma ceromatica** Grote, Plate XXVI, Fig. 34, ♀. (The Anointed Sallow.)

Ranges from New Jersey to Maine.

(3) **Scopelosoma walkeri** Grote, Plate XXVI, Fig. 35, ♂. (Walker’s Sallow.)

The moth is known to fly from Texas to Iowa and eastward to Maine and Canada. The larva feeds upon oaks.

(4) **Scopelosoma devia** Grote, Plate XXVI, Fig. 42, ♂. (The Lost Sallow.)

It occurs in northern New York and Canada.

Genus **ORRHODIA** Hübner

The genus is found both in Europe and America. Prof. Smith has attributed to it a species to which he gave the name of **californica**. The type is in the United States National Museum and the annexed figure gives a representation of it. It is the only species of the genus in our fauna.

Genus **GLÆA** Hübner

(1) **Glaea viatica** Grote, Plate XXVI, Fig. 38, ♂. (The Roadside Sallow.)

The species appears very late in the fall of the year. It ranges from Texas in the south to Massachusetts in the north.

(2) **Glaea inulta** Grote, Plate XXVI, Fig. 37, ♂. (The Unsated Sallow.)

The moth ranges from Canada to Virginia and westward to Illinois and Iowa.

(3) **Glaea sericea** Morrison, Plate XXVI, Fig. 36, ♂. (The Silky Sallow.)

The range of this species is much the same as that of the preceding.
Explanation of Plate XXVI

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

</tbody>
</table>
Genus **EPIGLÆA** Grote

(1) *Epiglæa pastillicans* Morrison, Plate XXVI, Fig. 41, ♂. (The Round-loaf Sallow.)
The species occurs from West Virginia to Maine, and westward to Ohio.

(2) *Epiglæa decliva* Grote, Plate XXVI, Fig. 40, ♂. (The Sloping Sallow.)
Syn. *deleta* Grote.
The moth occurs from Canada to Virginia, and westward to Illinois.

Genus **HOMOGLÆA** Morrison

(1) *Homoglaea hircina* Morrison, Plate XXVI, Fig. 39, ♂. (The Goat Sallow.)
The habitat of this species is the northern part of our territory. It ranges from Alberta to Nova Scotia, and southward along the Alleghany Mountains into the Western part of North Carolina.

(2) *Homoglaea carbonaria* Harvey, Plate XXV, Fig. 14, ♀. (The Smudged Sallow.)
The species ranges from Washington and Oregon eastward to Colorado. It has been located in the genus *Euharveya*, but this name is a synonym for *Homoglaea*, according to Prof. J. B. Smith, and accordingly sinks.

Genus **CALYMNIA** Hübner

(1) *Calymnia orina* Guenee, Plate XXVII, Fig. 1, ♂. Syn. *canescens* Behr.
This easily identified moth ranges over the entire temperate portion of the North American continent. The larva feeds upon oaks.

Genus **ZOTHECA** Grote

(1) *Zotheca tranquila* Grote, Plate XXVII, Fig. 2, ♂. (The Western Elder Moth.)
Syn. *sambuci* Behr; *viridula* Grote.
The larva feeds upon elder (*Sambucus*). The moth ranges from northern California to British Columbia and eastward to Wyoming. The greener form was named *viridula* by Grote. The difference is hardly subspecific, as the shade of green on the wings is hardly alike in any two specimens, and the color soon fades out.
Noctuidae

Genus IPIMORPHA Hübner

(1) Ipimorpha pleonectusa Grote, Plate XXVII, Fig. 3, ♂.
(The Even-lined Sallow.)
Syn. aquilinea Smith.
The species occurs from the Atlantic to the Rocky Mountains.

Genus ATETHMIA Hübner

(1) Atethmia subusta Hübner, Plate XXVII, Fig. 4, ♂.
A very common species ranging through the warmer parts of the Gulf States through Central and South America as far as Argentina.

(2) Atethmia rectifascia Grote, Plate XXVII, Fig. 5, ♂.
Found from New Jersey to Illinois and southward.

Genus TRICHOCOSMIA Grote

(1) Trichocosmia inornata Grote, Plate XXVII, Fig. 6, ♂.
The insect is found in Arizona and northern Mexico.

Genus TRISTYLA SMITH

The genus was erected by Smith for the reception of a Californian species to which he gave the specific name alboplagiata. Through the kindness of the authorities of the United States National Museum I am able to give a representation of the type of this insect.

Genus ANTAPLAGA Grote

A small genus composed exclusively of western species.

(1) Antaplaga dimidiata Grote, Plate XXVII, Fig. 7, ♂.
Hitherto only reported from Colorado.

Genus GROTELLA Harvey

(1) Grotella dis Grote, Plate XXVII, Fig. 8, ♂.
A small moth found in New Mexico and Arizona.

220
Genus PIPPONA Harvey

The only species hitherto referred to this genus is found in Texas. We give in the cut, which is herewith presented, a figure of a specimen which is contained in the American Museum of Natural History, and which was carefully drawn for this book by Mrs. Beutenmüller. It was named bimatis by Dr. Harvey.

Genus BESSULA Grote

Through the kindness of the authorities of the British Museum and Sir George F. Hampson I am able to give herewith a figure of the type of the genus and species, which is preserved in the Grote Collection. The moth occurs in New Mexico and Colorado.

Genus OXYCNEMIS Grote

This genus is composed wholly of species which are found in the southwestern portions of our territory. Of one of these, found in California, to which Smith has applied the specific name fusimacula, we are permitted to give a figure taken from a specimen preserved in the American Museum of Natural History. It was drawn by Mrs. Beutenmüller.

Genus NYCTEROPHÆTA Smith

(1) Nycterophæta luna Morrison, Plate XXVII, Fig. 9, ♀.
Syn. magdalena Hulst; notatella Grote.

The moth ranges from Dakota and Montana southward to southern Colorado.
Noctuidæ

Genus COPABLEPHARON Harvey

(1) Copablepharon grandis Strecker, Plate XXVII, Fig. 10, ♂. The species ranges from northern California and Oregon eastward to Montana.

(2) Copablepharon longipenne Grote, Plate XXVII, Fig. 11, ♀.

From the preceding species it may easily be distinguished by its much greater size. It has thus far only been found in Montana.

(3) Copablepharon album Harvey, Plate XXVII, Fig. 12, ♂.

The fore wings in this species are pure white, and not shaded with yellow, as is the case with the other two species, which have been mentioned. It occurs from Oregon to Montana and southward to Colorado.

Genus THYREION Smith

(1) Thyreion rosea Smith, Plate XXII, Fig. 13, ♀.

This insect is thus far only known to occur in Colorado.

Genus CHLORIDEA Westwood

(1) Chloridea virescens Fabricius, Plate XXVII, Fig. 14, ♂.

Syn. rhexia Abbot & Smith; spectanda Strecker.

Found from the Atlantic to the Pacific and from Canada southward into Mexico.

Genus HELIOCHEILUS Grote

(1) Heliocheilus paradoxus Grote, Plate XXVII, Fig. 15, ♂.

The insect ranges from the middle of the Mississippi Valley south and west. It does not appear to be common in collections.

Genus HELIOTHIS Ochsenheimer

The genus is represented in both hemispheres by a number of species. It used to be made to include a large assemblage of insects, but latterly has been restricted by authors.

(1) Heliothis armiger Hübner, Plate XXVII, Fig. 17, ♂.

(The Boll-worm.)

This insect, which is known to English entomologists as the “Scarce Bordered Straw,” is unfortunately not scarce in the
United States, and being of a singularly gluttonous habit in the larval stage, has become the object of execration to farmers and horticulturists. It is a very promiscuous feeder, but shows a special fondness for young Indian corn in the ear and for cotton bolls. On account of the latter peculiarity it has received the name we have applied above. It attacks the fruit of the tomato when still green, and causes it to rot on the vines. It also feeds upon pumpkins, peas, beans, hemp, and, it is said, upon tobacco.

An excellent account of its habits has been given by Prof. C. V. Riley in his "Third Annual Report" as State Entomologist of Missouri. It is from that paper that we have extracted the figures, which are herewith given, and which serve to illustrate the life-history of the insect. The moth ranges all over the United States and southern Canada. It is most abundant in the southern portion of our territory, where there are from three to four broods annually. It is here in the

---

**Fig. 130.**—Boll-worm feeding upon a tomato. (After Riley.)

**Fig. 131.**—*Heliothis armigera*. a. Egg viewed from the side; b. Egg viewed from on top (both eggs magnified); c. Larva; d. Pupa; e-f. Moth. (After Riley.)
Noctuidæ

cotton-fields and in the growing corn that the greatest damage is inflicted. There appears to be no way of applying remedies in a wholesale manner to the crops so as to prevent the depredations of this insect. The only resort is for the grower to go carefully over the fields, and where he detects the presence of the insects in their early stages, to pick them off and destroy them. In the case of corn the presence of the worm is shown by the premature drying of the silk, and in the case of cotton by the fallen flower-buds, which lie withering on the ground.

(2) Heliothis scutosus Fabricius, Plate XXVII, Fig. 16, ♂.
(The Spotted Clover-moth.)
Syn. nuchalis Grote.
This species, which occurs in Europe and Asia, is also found not infrequently in the western part of our territory.

Genus DERRIMA Walker

(1) Derrima stellata Walker, Plate XXIX, Fig. 67, ♂.
(The Pink Star-moth.)
Syn. henrietta Grote.
The specimen figured was taken in Maine. We also give a cut taken from a specimen in the American Museum of Natural History. It is a rare insect, but widely distributed from New England to the Mississippi through the northern tier of states.

Genus RHODOPHORA Guenée

(1) Rhodophora gauræ Abbott & Smith, Plate XXVII, Fig. 18, ♂.
Syn. matutina Hübner.
A very common species in the southern and southwestern portions of our territory. The larva feeds upon Gaura biennis.
(2) Rhodophora florida Guenée, Plate XXVII, Fig. 19, ♂.
Ranges from Canada to the Carolinas and westward as far as Utah.
(3) Rhodophora citronellus Grote & Robinson, Plate XXVII, Fig. 20, ♂.
This is a common species in Texas and Arizona. It occurs also in Colorado.
Genus RHODOSEA Grote

(1) Rhodosea julia Grote, Plate XXVII, Fig. 53, ♀.
The moth occurs in New Mexico and southward to northern Mexico. The specimen figured on the plate is contained in the United States National Museum.

Genus RHODODIPSA Grote

(1) Rhododipsa volupia Fitch, Plate XXVII, Fig. 22, ♂.
Habitat Colorado and Texas.
(2) Rhododipsa miniana Grote, Plate XXVII, Fig. 23, ♂.
The insect occurs in New Mexico.
(3) Rhododipsa masoni Smith, Plate XXVII, Fig. 24, ♀.
This species has thus far only been reported from Colorado.

Genus TRIOCNEMIS Grote

There is only one species of this genus, to which Grote applied the specific name saporis. The male is depicted on Plate XXVII, Fig. 21. It ranges from Washington and California eastward to Colorado.

Genus PSEUDACONTIA Smith

This is another genus represented thus far by one species. The insect received the specific name crustaria at the hands of Morrison. The figure we give was taken from a specimen contained in the United States National Museum at Washington. The insect ranges from Nebraska to Colorado and Wyoming.

Fig. 133.—Pseudaconta crustaria.

Genus GRÆPERIA Grote

The only species attributed thus far to this genus is still a rare insect in collections. We give a figure of the type contained in the collection of the late Berthold Neumægen, which is preserved at the Brooklyn Institute. The insect occurs in Texas. The fore wings are deep maroon, edged anteriorly with pale creamy white.
Noctuidae

Genus PORRIMA Grote

(i) Porrima regia Strecker, Plate XXVII, Fig. 26, ♀.
This is a southern species, found in Texas, and also ranging northward as far as Kansas and Colorado.

Genus TRICHOSELLUS Grote

(i) Trichosellus cupes Grote.
Syn. crotchii Henry Edwards.
This little moth, which is the only one belonging to the genus, is represented in the annexed figure by a drawing of the type, which is preserved in the American Museum of Natural History.

Genus EUPANYCHIS Grote

The only species belonging to the genus was originally named spinosæ by Guenée. Grote & Robinson subsequently called it hirtella. It occurs from Canada southward to the Potomac and westward to Illinois. The figure we give is from a drawing of a specimen in the United States National Museum.

Genus CANIDIA Grote

Fig. 137.—Canidia scissa.
This is a Floridan species, a figure of the type of which has been prepared for this book under the supervision of Sir George F. Hampson.

Genus SCHINIA Hübner

This is a very extensive genus of small and rather pretty moths, which are particularly abundant in the grassy and semiarid
lands of the southwestern States. There are, however, a number of species, which occur in the Atlantic subregion.

1. **Schinia chrysellus** Grote, Plate XXVII, Fig. 28, ♀.
   The fore wings are silvery white. The insect is strikingly beautiful, and is not at all uncommon in the States of Colorado, New Mexico, and Texas.

2. **Schinia aleucis** Harvey, Plate XXVII, Fig. 29, ♂.
   This species is smaller than the preceding, which it resembles in a general way. The hind wings are darker. It occurs in Texas.

3. **Schinia cumatilis** Grote, Plate XXVII, Fig. 30, ♂.
   A beautiful species, with silvery-white wings. It may at once be distinguished from the two preceding species by the different arrangement of the bands upon the fore wings. It is found in Colorado, New Mexico, and Texas.

4. **Schinia trifascia** Hübner, Plate XXVII, Fig. 35, ♀.
   The moth is found from the Atlantic to the foothills of the Rocky Mountains in Colorado and Wyoming.

5. **Schinia simplex** Smith, Plate XXVII, Fig. 32, ♀.
   The home of this species is Colorado. The fore wings in some specimens are much brighter green than shown on the plate.

6. **Schinia nundina** Drury, Plate, XXVII, Fig. 33, ♂.
   Syn. *nigrirena* Haworth.
   This is a strikingly marked species, which cannot easily be mistaken for anything else. It ranges from New Jersey southward and westward to Illinois and Kentucky.

7. **Schinia acutilinea** Grote, Plate XXVII, Fig. 34, ♂.
   Syn. *separata* Grote.
   The moth is found in Colorado and Utah.

8. **Schinia brucei** Smith, Plate XXVII, Fig. 37, ♂.
   The home of the insect is Colorado.

9. **Schinia lynx** Guenée, Plate XXVII, Fig. 38, ♂.
   Is taken from Massachusetts to Florida and westward to the Mississippi.

10. **Schinia roseitincta** Harvey, Plate XXVI, Fig. 36, ♂.
    Has been found from Colorado to Texas.

11. **Schinia saturata** Grote, Plate XXVII, Fig. 43, ♂.
    Ranges from Massachusetts to Florida, and westward to Texas and southern California.
Noctuidae

(12) Schinia tertia Grote, Plate XXVII, Fig. 39, ♀.
This species is common in Texas.

(13) Schinia albahascia Smith, Plate XXVII, Fig. 45, ♀.
The habitat of this species is Utah and Colorado.

(14) Schinia jaguarina Guenée, Plate XXVII, Fig. 41, ♂.
The species ranges from western Pennsylvania to Nebraska and Colorado and southward to Texas.

(15) Schinia arcifera Guenée, Plate XXVII, Fig. 42, ♀.
Syn. spraguei Grote.
The species occurs from New England to New Mexico and southward.

(16) Schinia packardi Grote, Plate XXVII, Fig. 31, ♂.
Syn. mortua Grote; nobilis Grote.
Distributed from Colorado to Texas and Arizona.

(17) Schinia thoreaui Grote & Robinson, Plate XXVII, Fig. 46, ♂.
Ranging from the valley of the Ohio southward into Texas.

(18) Schinia marginata Haworth, Plate XXVII, Fig. 44, ♂.
Syn. rivulosa Guenée; divergens Walker; contracta Walker; designata Walker.
Found from New York to Iowa and thence southward.

(19) Schinia brevis Grote, Plate XXVII, Fig. 40, ♂.
Syn. atrites Grote.
This species is spread from Massachusetts to Iowa and southward to New Mexico.

Genus DASYSPOUDEAE Smith

(1) Dasyspoudæa lucens Morrison, Plate XXVII, Fig. 47, ♂.
A common insect in Nebraska and westward in Colorado and Wyoming.

(2) Dasyspoudæa meadi Grote, Plate XXVII, Fig. 48, ♂.
Ranges from Montana southward to Colorado.

Genus PSEUDANTHECIA Smith

(1) Pseudanthæcia tumida Grote, Plate XXVII, Fig. 49, ♂.
This insect occurs from Colorado to the higher plateaus of northern Mexico. It is common in Chihuahua.

228
Explanation of Plate XXVII

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Calymnia orina Guenée, ♀.
2. Zotheca tranquilla Grote, ♀.
3. Ipimorpha pleoneuctusa Grote, ♀.
4. Atelthmia subusta Hübner, ♀, U. S. N. M.
5. Atelthmia rectifascia Grote, ♀, U. S. N. M.
6. Trichocosmia inornata Grote, ♀, U. S. N. M.
7. Antaplaga dimidiata Grote, ♀.
8. Grotella dis Grote, ♀, U. S. N. M.
10. Copablepharon grandis Streeker, ♀.
11. Copablepharon longipenne Grote, ♀, U. S. N. M.
12. Copablepharon album Harvey, ♀.
13. Thyreion rosea Smith, ♀, U. S. N. M.
15. Heliocheilus, paradoxus Grote, ♀.
17. Heliothis arniger Hübner, ♀.
18. Rhodophora gaara Abbot & Smith, ♀.
21. Triocnemis saporis Grote, ♀, U. S. N. M.
22. Rhododipsa volupia Fitch, ♀.
23. Rhododipsa miniana Grote, ♀.
24. Rhododipsa masoni Smith, ♀.
25. Pseudotamila vanella Grote, ♀, U. S. N. M.
26. Porrina regia Streeker, ♀.
27. Porrina gloriosa Streeker, ♀.
28. Schinia chrysellus Grote, ♀.
29. Schinia aleucis Harvey, ♀.
30. Schinia cumatilis Grote, ♀.
31. Schinia packardi, ♀.
32. Schinia simplex Smith, ♀.
33. Schinia mundina Drury, ♀.
34. Schinia acutilineae Grote, ♀.
35. Schinia trijascia Hübner, ♀.
36. Schinia rosctinina Harvey, ♀.
37. Schinia brevi-Smith, ♀.
38. Schinia lynx Guenée, ♀.
40. Schinia brevis Grote, ♀.
41. Schinia jaguarina Guenée, ♀.
42. Schinia arcifera Guenée, ♀.
43. Schinia sargina Grote, ♀.
44. Schinia marginata Haworth, ♀.
45. Schinia albifascia Smith, ♀.
46. Schinia thoreanni Grote & Robinson, ♀.
47. Dasyspoudcia lucens Morrison, ♀.
48. Dasyspoudcia meadi Grote, ♀.
49. Pseudanthecia tumida Grote, ♀.
50. Stylopora cephalica Smith, ♀.
51. Melicleptria sueta Grote, ♀.
52. Melicleptria pulchripennis Grote, ♀.
53. Rhodosea julia Grote, ♀, U. S. N. M.
56. Heliaca diminutivae Grote, ♀.
57. Axenus arvalis Grote, ♀.
58. Helioleofide modicella Grote, ♀.
59. Omia nessea Smith, ♀, U. S. N. M.
60. Xanthothrix neumagens Henry Edwards, ♀.
61. Heliophana mithis Grote, ♀.
Genus PALADA Smith

There is but one species of the genus, and we are able to give a figure of the type of this through the kindness of the authorities of the United States National Museum. It received the specific name *scarletina* at the hands of Prof. J. B. Smith. Its habitat is California.

Genus STYLOPODA Smith

(i) Stylopoda cephalica Smith, Plate XXVII, Fig. 50, ♂.
This is a very common species in southern California.

Genus SYMPISTIS Hübner

This is another of the many genera among the Heliothid moths, which are represented thus far in America by but a single species. The insect was named *proprius* by Henry Edwards, and we give a figure of the type which is in his collection now in the possession of the American Museum of Natural History.

Genus MELAPORPHYRIA Grote

This little genus contains three species. Of these we select one for illustration.

(i) Melaporphyria oregona Henry Edwards, Plate XXVII, Fig. 54, ♂.
The range of the species is from Colorado to Oregon.

Genus DYSOCNEMIS Grote

(i) Dysocnemis belladonna Henry Edwards, Plate XXVII, Fig. 55, ♂.
This beautiful little moth occurs in Utah.

Genus PSEUDOTAMILA Smith

(i) Pseudotamila vanella Grote, Plate XXVII, Fig. 25, ♂.
Found among the mountains of Nevada and California.
Noctuidae

Genus MELICLEPTRIA Hübner

(1) Melicleptria pulchripennis Grote, Plate XXVII, Fig. 52, ♂.
Syn. tanguida Henry Edwards.
The range of this insect is from Colorado to California.
(2) Melicleptria sueta Grote, Plate XXVII, Fig. 51, ♂.
Syn. californicus Grote.
Is distributed from Colorado to California.

Genus HELIOLONCHE Grote

(1) Heliolonche modicella Grote, Plate XXVII, Fig. 58, ♂.
The moth is distributed from California to Colorado and Wyoming.

Genus OMIA Hübner

(1) Omia nesæa Smith, Plate XXVII, Fig. 59, ♂.
The habitat of this little moth is California.

Genus HELIOPHANA Grote

(1) Heliophana mitis Grote, Plate XXVII, Fig. 61, ♂.
Syn. obliquata Smith.

Genus HELIODES Guenée

There are but two species so far known to belong to this genus. They both occur in California, and are among the smallest of the Heliothids. We give in the annexed cut a representation of the type of the species named restrictalis by Prof. J. B. Smith.

Genus HELIOSEA Grote

The figure of the type of the genus and the species is kindly loaned me for use in this book by Sir George F. Hampson. It is
Noctuidæ

Genus XANTHOTHRIX Henry Edwards

(1) Xanthothrix neumœgeni Henry Edwards, Plate XXVII, Fig. 60, ♀.
This pretty bright colored little moth occurs in California.

Genus AXENUS Grote

(1) Axenus arvalis Grote, Plate XXVII, Fig. 57, ♂.
Syn. ochraceus Henry Edwards; amptus Henry Edwards.
A common insect ranging from Colorado to California and southward.

Genus HELIACA Herrich-Schæffer

Five species are attributed to this genus, of which we illustrate one.
(1) Heliaca diminutiva Grote, Plate XXVII, Fig. 56, ♂.
The range of this species is the same as that of the last mentioned.

Genus EUPSEUDOMORPHA Dyar

(1) Eupseudomorpha brillians Neumœgen.
Of this beautiful insect, which is still very rare in collections, we give a figure drawn by the writer from the type, which is contained in the Neumœgen Collection. The moth inhabits Texas.

Genus XANTHOPASTIS Hübner

(1) Xanthopastis timais Cramer, Plate XI, Fig. 17, ♀.
Syn. regnatrix Grote.
This insect has a very wide range all over the tropics of the New World. It occurs not infrequently in the Gulf States, and occasionally ranges as far north as New York.
Genus **PSYCHOMORPHA** Harris

(1) **Psychomorpha epimenis** Drury, Plate III, Fig. 9, ♂.

This very beautiful little moth appears on the wing early in the spring in Pennsylvania. It is not uncommon in the Atlantic States. Hitherto it has been placed by many authors among the *Agaristidae*, but we incline to the opinion that it is better located where we have put it, among the *Noctuidae*. Larval characteristics, however, show a great likeness in this stage of development to the species included in the genus *Alypia*. The accompanying cut, which we have reproduced from the writings of Prof. C. V. Riley, may be compared in this connection with the figure of the larva of *Alypia octomaculata* given on page 144.

Genus **PSEUDALYPIA** Henry Edwards

This genus, like the preceding, has been located by some recent writers among the *Agaristidae*. The moth is undoubtedly a Noctuid. I have placed it here in the order of arrangement, believing that upon the whole it is better located at this point in the serial arrangement than anywhere else. The figure annexed is that of the type preserved in the American Museum of Natural History. It was drawn by Mrs. Beutenmüller.

Genus **EUTHISANOTIA** Hübner

(1) **Euthisanotia unio** Hübner, Plate XVII, Fig. 24, ♂. (The Pearly Wood-nymph.)

This lovely moth has a wide range throughout the eastern portions of our territory as far west as the Mississippi.

(2) **Euthisanotia grata** Fabricius, Plate XVII, Fig. 23, ♂. (The Beautiful Wood-nymph.)

*Syn. assimilis* Boisduval.
This is a much larger species than the preceding. It has practically the same range of distribution. The affinity of the genus to the genus *Psychomorpha* is clearly shown by the larva, a representation of which is given in the annexed cut taken from the writings of Prof. C. V. Riley, who devoted considerable time to the study of the life-history of these insects.

**Genus CIRIS Grote**

(1) *Ciris wilsoni* Grote, Plate XIX, Fig. 2, ♂

This insect occurs in Texas and Arizona. It has also been referred to the *Agaristidæ* and to the *Zygaenidæ* by various authors. There is, however, no doubt as to its being a true Noctuid.

**Genus NOROPSIS Guenée**

(1) *Noropsis hieroglyphica* Cramer, Plate XXVIII, Fig. 1, ♀.

This very pretty moth has a wide range in the hotter portions of America. It is found in Florida, and represents the invasion of our southern territory by the fauna of the Antilles, and South America.

**Genus FENARIA Grote**

(1) *Fenaria longipes* Druce, Plate XI, Fig. 16, ♂.

The species occurs in Arizona and ranges thence southwardly into Mexico.

(2) *Fenaria sevorsa* Grote, Plate XVII, Fig. 12, ♀.

Syn. *adessa* Druce.

The species has the same range as the preceding.

"I love the season well
When forest glades are teeming with bright forms."

LONGFELLOW. *An April Day.*

233
Genus **ACHERDOA** Walker

Only one species of the genus is attributed to it from our fauna. It received the specific name *ferraria* at the hands of the late Francis Walker, and was renamed *ornata* by Neumœgen. The cut we give was drawn by Mrs. Beutenmüller from a specimen in the American Museum of Natural History. It represents the male insect.

Genus **AON** Neumœgen

(1) Aon *noctuiformis* Neumœgen, Plate XLI, Fig. 18, ♂.
This is not an uncommon moth in southern Texas.

Genus **CIRRHOPHANUS** Grote

(1) Cirrhophanus *triangulifer* Grote, Plate XXVIII, Fig. 2, ♀.
The insect varies considerably in size, the specimen depicted on the plate being rather small. It is not an uncommon species in the southern States, and is also found as far north as Pennsylvania.

Genus **BASILODES** Guenée

(1) Basilodes *pepita* Guenée, Plate XXVIII, Fig. 7, ♀.
The genus *Basilodes* contains a number of species which are all, with the single exception of this species, natives of the southwestern portions of our territory. The present species occurs from Pennsylvania to Florida and westward to Colorado. The insect has been occasionally taken in Pittsburgh.

Genus **STIRIA** Grote

(1) Stiria *rugifrons* Grote, Plate XXVIII, Fig. 5, ♂.
The specimen figured on the plate was caught by the writer in southern Indiana. It is reported also from Kansas and Colorado. It probably has a wide range, but is as yet rare in collections.

Genus **STIBADIUM** Grote

(1) Stibadium *spumosum* Grote, Plate XXVIII, Fig. 3, ♀.
The insect ranges from New York to Colorado and southward. It is very abundant in southern Indiana, where it comes freely to sugar.
Genus **PLAGIOMIMICUS** Grote

There are five species reckoned as belonging to this genus. All of them are southwestern and western forms, except the one we figure.

(i) **Plagiomimicus pityochromus** Grote, Plate XXVIII, Fig. 9, ♀.

This moth is quite common in western Pennsylvania. It ranges southward and westward to the Gulf States and Colorado.

Genus **FALA** Grote

(i) **Fala ptycophora** Grote, Plate XXVIII, Fig. 4, ♀.

The habitat of this insect, which is the sole representative of its genus, is California.

Genus **NARTHECOPHORA** Smith

This is another genus in which we recognize thus far only one species.

(i) **Narthecophora pulverea** Smith, Plate XXVIII, Fig. 11, ♀.

The figure is taken from a specimen determined by the author of the species, and contained in the United States National Museum.

Genus **NEUMŒGENIA** Grote

The only species of this genus was named **poetica** by Grote. It is a beautiful little moth, the fore wings being bright metallic green, with a golden reflection, the light spot, which is outwardly trifid, and the costa being creamy yellow. The drawing for the annexed cut was made from the type which is preserved at the Brooklyn Institute.

Genus **PLUSIODONTA** Guenée

The only species of this small genus recognized as found in North America was named **compressipalpis** by Guenée. Walker renamed it **insignis**. It is represented on Plate XXVIII, Fig. 6, by a male specimen. The insect is a native of the Atlantic subregion, and is locally very common in western Pennsylvania.
Noctuidæ

Genus GONODONTA Hübner

This genus is representative of the tropical fauna of America, and but two species occur within our limits, both of them in the warmer parts of Florida.

(1) Gonodonta unica Neumöegen, Plate XXVIII, Fig. 10. ♂.

The larval stages have been well described by Dyar in the "Proceedings of the United States National Museum," Vol. XXIII, p. 272. The caterpillar feeds on Anona laurifolia, the Custard-apple.

Genus CALPE Treitschke

The genus Calpe is found in the temperate regions of both hemispheres. Only one species occurs in America.

(1) Calpe canadensis Bethune, Plate XXVIII, Fig. 8, ♀.

(The Canadian Calpe.)

Syn. purpurascens Walker; sobria Walker.

The range of this species is restricted to the colder portions of our territory. It is found in Canada, rarely in northern New York, and ranges westward to Alberta.

Genus PANCHRYSIA Hübner

This genus, which is generally known under Walker's name Deva, is better represented in the eastern hemisphere than in the western. We figure one species of the four credited to our fauna.

(1) Panchrysia purpurigera Walker, Plate XXVIII, Fig. 13, ♂.

This pretty little moth, which is not very common, ranges from New England and Canada to Colorado and New Mexico.

Genus POLYCHRYSIA Hübner

Two species, both of which we figure, are attributed to this genus as occurring within our territory.

(1) Polychrysia moneta Fabricius, Plate XXVIII, Fig. 12, ♀.

Syn. trabea Smith.

This is a European insect, which is found also in Alberta and Assiniboia.

(2) Polychrysia formosa Grote, Plate XXVIII, Fig. 14, ♂.

So far, all the specimens which have come under the observation of the writer have been taken in New England or in New York.

236
Genus PLUSIA Hübner

Three of the four species attributed to the genus as found in America are represented upon our plate.

1. *Plusia ærea* Hübner, Plate XXVIII, Fig. 16, ♂.
The moth ranges from Nova Scotia to Florida and westward to Texas and the region of the Rocky Mountains.

2. *Plusia æroides* Grote, Plate XXVIII, Fig. 17, ♂.
The distribution of this species is almost identical with that of *Plusia ærea*. The larva feeds on various species of *Spiræa*.

3. *Plusia balluca* Geyer, Plate XXVIII, Fig. 22, ♀.
The species is not uncommon in the northern Atlantic States.

Genus EUCHALCIA Hübner

1. *Euchalcia contexta* Grote, Plate XXVIII, Fig. 23, ♂.
The species is found from Maine to Wisconsin, and occasionally as far south as the mountains of central Pennsylvania.

2. *Euchalcia putnami* Grote, Plate XXVIII, Fig. 15, ♂.
Dr. Dyar with questionable correctness treats this species as a form of the European *festulæ* Linnaeus. There is no doubt of the distinctness of the two.

3. *Euchalcia venusta* Walker, Plate XXVIII, Fig. 21, ♀.
*Syn. striatella* Grote.
The range of this species is from Nova Scotia and Canada southward to the mountains of West Virginia.

Genus EOSPHOROPTERYX Dyar

1. *Eosphoropteryx thyatiroides* Guenée, Plate XXVIII, Fig. 18, ♂.
This lovely moth is still very rare in collections. It ranges from New England and Canada to the mountains of Virginia and westward into the Valley of the Mississippi.

Genus AUTOGRAPH A Hübner

This is a large assemblage of species, about fifty being recognized as occurring in the United States. Of this number we are only able to figure about one third.
Noctuidae

(1) Autographa bimaculata Stephens, Plate XXVIII, Fig. 19, ♂.
Syn. *u-brevis* Gueneé.
This is a common species in the northern Atlantic States.

(2) Autographa biloba Stephens, Plate XXVIII, Fig. 24, ♂.
The species is distributed widely from the Atlantic to the Pacific.

(3) Autographa verruca Fabricius, Plate XXVIII, Fig. 20, ♂.
Syn. *omega* Hübner; *omicron* Hübner; *questionis* Treitschke; *rutila* Walker.
The moth is scarce in the northern Atlantic States, but has been recorded as occurring in Massachusetts. It ranges from New England to Texas and southward through Central and South America.

(4) Autographa rogationis Gueneé, Plate XXVIII, Fig. 25, ♂.
Syn. *hamifera* Walker; *dyaus* Grote; *includens* Walker; *culта* Lintner.
The range of this species is the same as that of the preceding.

(5) Autographa precationis Gueneé, Plate XXVIII, Fig. 28, ♂.
The insect is found in Canada and the United States east of the Rocky Mountains.

(6) Autographa egena Gueneé, Plate XXVIII, Fig. 29, ♂.
This is a southern species, occurring in Florida and the Gulf States, and ranging southward into South America.

(7) Autographa flagellum Walker, Plate XXVIII, Fig. 27, ♂.
Syn. *monodon* Grote; *insolita* Smith.
The species ranges from Quebec to Alberta.

(8) Autographa pseudogamma Grote, Plate XXVIII, Fig. 35, ♂.
The insect is indigenous in Quebec and Nova Scotia.

(9) Autographa ou Gueneé, Plate XXVIII, Fig. 33, ♂.
Syn. *fratetta* Grote.
This species is almost universally distributed through the United States and southern Canada.

(10) Autographa brassicae Riley, Plate XXVIII, Fig. 36, ♂.
Syn. *echinocystis* Behr.
This insect, which preys upon the *Cruciferae* in its larval state, has been well described and its habits fully set forth by Prof. C. V. Riley in the Missouri Reports. It is from his paper upon the species that we have been permitted to extract the figure which is here-with annexed of the insect in its various stages. The moth appears to be very generally distributed throughout the United States and Canada, and does a good deal to diminish the supply of the raw material from which sauer-kraut is made.

(11) *Autographa oxygramma* Geyer, Plate XXVIII, Fig. 30, ♂.
Syn. *indigna* Walker.

The moth is found in the southern States, and thence southward to South America.

(12) *Autographa rectangula* Kirby, Plate XXVIII, Fig. 32, ♀.
Syn. *mortuarum* Guenée.

This lovely species is northern in its range. I found it quite abundant one summer at Saratoga, New York.

(13) *Autographa vaccinii* Henry Edwards, Plate XXVIII, Fig. 34, ♂.

This species may easily be distinguished by the strongly checkered fringes of the primaries.

(14) *Autographa selecta* Walker, Plate XXVIII, Fig. 39, ♂.
Syn. *viridisignata* Grote.

This is a somewhat large species, not very attractively colored. It is northern in its range.

(15) *Autographa angulidens* Smith, Plate XXVIII, Fig. 38, ♀.
Noctuidae

The species is found in Colorado, and probably has a wide range in the Rocky Mountains.

(16) Autographa ampla Walker, Plate XXVIII, Fig. 31, ♀.
This fine species is northern in its range, but extends its habitat southward along the ranges of the great mountains of the west.

(17) Autographa basigera Walker, Plate XXVIII, Fig. 26, ♂.
Syn. laticlavia Morrison.
The insect occurs in the Appalachian subregion.

(18) Autographa simplex Guèneé, Plate XXVIII, Fig. 37, ♂.
This is one of the very commonest species of the genus, which is apparently universally distributed throughout our country.

Genus SYNGRAPH A Hübner

This genus is composed of species which are subpolar in their habitat. Of the four species which are reckoned as belonging to the fauna of North America, we illustrate two.

(1) Syngrapha hochenwarthi Hochenwarth, Plate XXVIII, Fig. 41, ♂.
Syn. divergens Fabricius.
Found everywhere in Arctic America. The specimen figured was taken in Labrador.

(2) Syngrapha devergens Hübner, Plate XXVIII, Fig. 40, ♀.
Syn. alticola Walker.
The species is found in Labrador, and has been reported from the high mountains of Colorado. It will probably be found to have a wide range.

Genus ABROSTOLA Ochsenheimer

We give representations of both the species which occur in our fauna.

(1) Abrostola urentis Guèneé, Plate XXVIII, Fig. 42, ♂.
The insect, which is by no means common, is found in the Appalachian subregion.

(2) Abrostola ovalis Guèneé, Plate XXVIII, Fig. 43, ♂.
The range of this insect is the same as that of the last mentioned.
Explanation of Plate XXVIII

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Noropsis hieroglyphica Cramer, ♀.
2. Cirrhophanus triangulifer Grote, ♀, U. S. N. M.
4. Fala ptychophora Grote, ♀, U. S. N. M.
5. Stiria rugifrons Grote, ♀.
6. Plusiodonta compressipalpis Guenee, ♀.
8. Calpe canadensis Bethune, ♀, U. S. N. M.
10. Gonodonta unica Neumayen, ♀, U. S. N. M.
11. Narthecophora pulverea Smith, ♀, U. S. N. M.
12. Polychrysa moneta Fabricius, var. esmerelda, Oberthur, ♀.
15. Euchalcia putnami Grote, ♀.
17. Plusia aeroides Grote, ♀.
18. Eosphoropteryx thyattroides Guenee, ♀.
19. Autographa bimaculata Stephens, ♀.
20. Autographa verruca Fabricius, ♀.
23. Euchalcia contexta Grote, ♀.
25. Autographa rogonitis Guenee, ♀.
27. Autographa flagellum Walker, ♀.
28. Autographa precatonis Guenee, ♀.
29. Autographa egena Guenee, ♀.
32. Autographa rectangula Kirby, ♀.
33. Autographa ou Guenee, ♀.
34. Autographa vaccini Henry Edwards, ♀.
35. Autographa pseudogamma Grote, ♀.
36. Autographa brassica Riley, ♀.
37. Autographa simplex Guenee, ♀.
38. Autographa angulidens Smith, ♀.
40. Syngrapha degervens Hübner, ♀.
41. Syngrapha hochenwarthi Hoehnwarth, ♀.
42. Abrostola urentis Guenee, ♀.
43. Abrostola ovata Guenee, ♀.
44. Behrensia conchiformis, Grote, ♀, U. S. N. M.
Genus **BEHRENSIA** Grote

Only one species has thus far been attributed to this genus.

(1) *Behrensia conchiformis* Grote, Plate XXVIII, Fig. 44, ♂.

This little insect, which is as yet very rare in collections, is found in northern California and Oregon.

Genus **DIASTEMA** Guenée

(1) *Diastema tigris* Guenée.

The sole species belonging to the genus, which occurs within our borders, has been reported from Florida. We give in the accompanying cut an illustration of a specimen which is found in the American Museum of Natural History.

Genus **OGDOCONTA** Butler

(1) *Ogdoconta cinereola* Guenée, Plate XXIX, Fig. 1, ♀.

Syn. *atomaria* Walker.

This is not at all an uncommon species in the Atlantic sub-region. I have found it particularly abundant in southern Indiana, where it comes freely both to light and to sugar.

Genus **PÆCTES** Hübner

Eight species are enumerated as belonging to this genus in Dyar's recently published Catalogue. Of these we have given illustrations of three in our plates.

(1) *Pæctes abrostoloides* Guenée, Plate XXIX, Fig. 3, ♀.

The insect occurs in the Atlantic States, and ranges westward into the Mississippi Valley.

(2) *Pæctes pygmaea* Hübner, Plate XXIX, Fig. 2, ♂.

This is a southern species. The specimen from which the figure on the plate was taken was captured in Texas.

(3) *Pæctes oculatrix* Guenée, Plate XXIX, Fig. 4, ♂.

The species is by no means very common. It has a wide range from the Atlantic into the basin of the Mississippi. The specimen figured on the plate was taken in western Pennsylvania. I have specimens from Indiana and Illinois.
Genus **EUTELIA** Hübner

(1) *Eutelia pulcherrima* Grote.

Syn. *dentifera* Walker.

The only species of this genus known to occur within our territory is that which is figured in the accompanying cut, which was made from the type now in the possession of the British Museum. The insect is found in New York and New Jersey, but probably has a wider southern range. It is as yet very rare in collections.

Genus **MARASMALUS** Grote

(1) *Marasmalus inficita* Walker, Plate XXIX, Fig. 6, ♂

Syn. *histrio* Grote.

This species is found from the northern Atlantic States and Canada southward and westward to Texas and Colorado.

(2) *Marasmalus ventilator* Grote, Plate XXIX, Fig. 5, ♀

This species, which is considerably larger than the preceding, has the wings more or less marked by reddish scales, which enables it to be easily discriminated from its congener. Its range is practically the same.

Genus **AMYNA** Guenée

(1) *Amyna octo* Guenée, Plate XXIX, Fig. 7, ♀

This little moth has suffered more than any other known to the writer by being made the sport of the makers of synonyms. No less than nineteen synonyms have been applied to it in addition to its true name. In Dyar's Catalogue it appears under the name *orbica* Morrison, and *tecta* Grote is given as a synonym. The student who wishes to know what some of the other names are which have been given to it may consult Hampson's "Moths of India," Vol. II, p. 251. It is found throughout the hot lands of both hemispheres.
Genus PTERÆTHOLIX Grote

(1) Pteræholix bullula Grote, Plate XXIX, Fig. 8, δ.
The habitat of this little moth is the Gulf States.

Genus Alabama Grote

(1) Alabama argillacea Hübner, Plate XXIX, Fig. 11, δ.
(The Cotton-worm Moth).

Syn. xylina Say; grandipuncta Guèneé; bipunctina Guénée.

The Cotton-worm Moth is one of a number of insects which annually inflict a vast amount of damage upon the crops in the southern portion of our country. In Prof. Comstock’s “Report upon the insects which are injurious to cotton,” published in 1879, and in the “Fourth Report of the United States Entomological Commission,” there is given a great deal of valuable and interesting information in regard to this species. Much may also be learned about it from the study of the “Missouri Reports” published by the late Prof. C. V. Riley. The range of the insect is very broad. It sometimes, though very rarely, occurs as far north as Canada. From this northernmost location it has been found ranging southward as far as Argentina. It sometimes appears to migrate in swarms. A number of years ago, during a heavy snowstorm in November, myriads of the moths suddenly appeared in the city of Pittsburgh, and they came flying in the evening to the electric lights. From one store the proprietor said that he had swept them out by the
Noctuidæ

quart. I have a few of the insects which thus appeared, and the figure on the plate is taken from one of these specimens.

Genus ANOMIS Hübner

The species belonging to this genus are mainly southern. There is considerable uncertainty as to the identification of some of the species, which were named by the older authors. Of the four reputed to be found within our limits we figure the one which is commonest.

(1) Anomis erosa Hübner, Plate XXIX, Fig. 12, ♂.
Occasionally found as far north as New England. Ranging thence southward into the South American continent.

Genus SCOLECOCAMPA Guenée

The only species of the genus so far known to occur in the United States was named liburna by Geyer. Guenée subsequently called it ligni. The larva feeds in decaying wood, particularly that of oaks, chestnuts, and hickories. It tunnels its way through the softer parts, and after reaching maturity makes a loose cocoon composed of a few strands of silk mixed with chips and the frass left in the burrow, from which it emerges in due season as the moth, which is represented on Plate XXIX, Fig. 16, by a male specimen.

Genus EUCALYPTERA Morrison

A small genus, the species of which are confined to the southern States and to Mexico and Central America.

(1) Eucalyptera strigata Smith, Plate XXIX, Fig. 9, ♂.
The habitat of this species is Texas.

Genus CILLA Grote

(1) Cilla distema Grote, Plate XXIX, Fig. 10, ♂.
This obscure little moth, the only representative of the genus in our territory, has hitherto only been reported from Texas.

Genus AMOLITA Grote

(1) Amolita fessa Grote, Plate XXIX, Fig. 13, ♂.
The moth occurs from Massachusetts to Florida and westward to Texas and Colorado.
Genus RIVULA Guenée

(1) Rivula propinqualis Guenée, Plate XXIX, Fig. 14, ♀.
The range of this insect is from Nova Scotia to Texas, and across the continent as far as the Rocky Mountains.

Genus PSEUDORYGIA Harvey

(1) Pseudorgyia versuta Harvey, Plate XXIX, Fig. 17, ♂.
This insect is thus far only known to us from Texas.

Genus DORYODES Guenée

(1) Doryodes bistriaris Geyer, Plate XXIX, Fig. 15, ♂.
Syn. acutaria Herrich-Schaeffer; divisa Walker; promptella Walker.
There are three species of the genus found in our territory, one of them, so far as is known to the writer, as yet unnamed. The insect we are considering ranges from Maine to Florida and westward to Colorado.

Genus PHIPROSOPUS Grote

(1) Phiprosopus callitrichoides Grote, Plate XXIX, Fig. 18, ♀.
Syn. nasutaria Zeller; acutalis Walker.
The species ranges from New York to Texas.

Genus ANEPISCHETOS Smith

The only species thus far referred to this genus, which was erected by Smith in 1900 for its reception, received at the hands of that author the specific name bipartita. A figure of the type, which is contained in the collection of the United States National Museum, is given in the accompanying cut.

Genus DIALLAGMA Smith

This genus was erected at the same time as the preceding by the same author for the reception of the insect of which we give a representation in Fig. 153. Its habitat, as also that of the last mentioned species, is Florida.
Noctuidae

Genus PLEONECTYPTERA Grote

This is a genus of moderate size, which by some writers has heretofore been placed among the Pyralidæ, though it is undoubtedly correctly located among the Noctuidæ. Eight species are credited to our fauna in the latest catalogue.

(1) Pleonectyptera pyralis Hübner, Plate XXIX, Fig. 19, ♀.
   Syn. irrecta Walker; floccalis Zeller.
   The insect ranges through the southern Atlantic States to Central and South America.

Genus ANNAPHILA Grote

A genus of moderate extent, embracing over a dozen species, which are found within the United States.

(1) Annaphila diva Grote, Plate XXIX, Fig. 20, ♂.
   The habitat of this pretty little moth is California.

(2) Annaphila lithosina Henry Edwards, Plate XXIX, Fig. 21, ♀.
   The specimen figured in the plate came from southern California.

Genus INCITA Grote

Only a single species, the type of the genus, is known. The figure we give in the annexed cut is drawn from the type in the possession of the American Museum of Natural History in New York.

Genus TRICHOTARACHE Grote

The sole representative of this genus in our fauna is the insect the type of which is given in the accompanying figure, drawn for this work by Mr. Horace Knight, of London.

The habitat of the moth is California.
Genus EUSTROTIA Hübner

This is quite an extensive genus, of which eighteen species are included in our fauna. Of this number we give illustrations of seven.

1. **Eustrotia albidula** Guenée, Plate XXIX, Fig. 22, ♀.
   Syn. *intractabilis* Walker.
   This little moth ranges from the Atlantic to the Mississippi, and further west.

2. **Eustrotia concinnimacula** Guenée, Plate XXIX, Fig. 23, ♀.
   Not an uncommon species in the Atlantic subregion.

3. **Eustrotia synochitis** Grote & Robinson, Plate XXIX, Fig. 24, ♂.
   The distribution of this species is the same as that of the last. It occurs from Canada to Texas.

4. **Eustrotia musta** Grote & Robinson, Plate XXIX, Fig. 25, ♂.
   Found from the Atlantic to the Rocky Mountains.

5. **Eustrotia muscosula** Guenée, Plate XXIX, Fig. 26, ♀.
   The moth has the same ranges as the last mentioned species. It is very common in Indiana.

6. **Eustrotia apicosa** Haworth, Plate XXIX, Fig. 27, ♂.
   Syn. *nigritula* Guenée.
   A very common species, having the same range as its predecessor.

7. **Eustrotia carneola** Guenée, Plate XXIX, Fig. 28, ♀.
   What has been said of the last species applies also to this, except that it is, if anything, even more common.

Genus GALGULA Guenée

1. **Galgula hepara** Guenée, Plate XXIX, Fig. 31, ♂.
   Form *partita* Guenée, Plate XXIX, Fig. 32, ♂.
   Syn. *vesca* Morrison; *subpartita* Guenée.
   This common insect exists, as is shown in the plates, in two forms, one quite dark, the other lighter. It is an inhabitant of the Atlantic subregion, and is particularly abundant in western Pennsylvania.
Noctuidæ

Genus AZENIA Grote

(1) Azenia implora Grote, Plate XXIX, Fig. 29, ♀.
Not an uncommon insect in Arizona.

Genus LITHACODIA Hübner

(1) Lithacodia bellicula Hübner, Plate XXIX, Fig. 30, ♂.
This little moth may be found from the Atlantic to the Rocky Mountains. It is the only species of its genus occurring in the United States.

Genus PROTHYMIA Hübner

(1) Prothymia rhodarialis Walker, Plate XXIX, Fig. 38, ♀.
Syn. coccineifascia Grote.
The species ranges from Massachusetts to Texas.
(2) Prothymia semipurpurea Walker, Plate XXIX, Fig. 36, ♀.
The species has the same range as the last. The specimen figured was taken at New Brighton, Pa., by the Messrs. Merrick, whose ardent and successful labors as collectors of the local fauna deserve all praise.
(3) Prothymia orgyiae Grote, Plate XXIX, Fig. 37, ♂.
This is a Texan species.

Genus EXYRA Grote

(1) Exyra semicrocea Guenée, Plate XXIX, Fig. 35, ♀.
There are four species of the genus Exyra attributed to our fauna, but only one of these is figured. The species are mainly southern in their range. Exyra semicrocea is found from New Jersey southward and westward as far as Texas.

Genus XANTHOPTERA Guenée

Two of the four species which are found within the limits of the United States are represented upon our plates.
(1) Xanthoptera nigrofimbria Guenée, Plate XXIX, Fig. 33, ♂.
The insect is found in the southern portions of the Appalachian subregion.
Noctuidae

(2) Xanthoptera semiflava Gueneé, Plate XXIX, Fig. 34, §.
The distribution of this species is identical with that of the one last mentioned.

Genus THALPOCHARES Lederer
The only species of this genus found within our faunal limits is a native of Florida. It received the specific name aetheria at the hands of Mr. Grote. The illustration we give is drawn from the type which is preserved in the British Museum, and was drawn for this book by Mr. Horace Knight under the direction of Sir George F. Hampson. The insect is not common in collections.

Genus EUMESTLETA Butler
Seven species are given by Dyar in his Catalogue as occurring within the limits of the United States. The insects have a southern and southwestern range, occurring in the Gulf States and in Arizona. We have selected one of them for illustration.

(1) Eumestleta flammicincta Walker, Plate XXIX, Fig. 39, §.
S.n. patula Morrison; patruelis Grote.
The habitat of this insect is Florida and Texas.

Genus GYROS Henry Edwards
There is only one species of this genus known. It received the name muiri through Mr. Henry Edwards in honor of his friend, John Muir, the well-known writer, whose charming descriptions of the natural beauties of the western portions of our continent have established for him an enviable position in the world of letters. The moth is found in California.

Fig. 156.—Thalpochares aetheria, °. ½.

Fig. 157.—Gyros muiri, ®. ½.
Noctuidæ

Genus TRIPUDIA Grote

This is a genus of considerable size, represented in the western and southwestern States by nine species, and well represented in the fauna of Mexico and Central America.

(1) Tripudia opipara Henry Edwards, Plate XXIX, Fig. 40, ♂.
This is a very common species in Texas.

Genus METAPONIA Duponchel

The genus is represented in both hemispheres. Three species occur in our fauna. Of these we figure two.

(1) Metaponia obtusa Herrich-Schäffer, Plate XXIX, Fig. 41, ♀.

Syn. obtusula Zeller.

The insect occurs from the valley of the Ohio southward to Texas. It is commoner in the south than in the north.

(2) Metaponia perflava Harvey, Plate XXIX, Fig. 42, ♀.
Not an uncommon species in Texas.

Genus CHAMYRIS Guenée

(1) Chamyris cerintha Treitschke, Plate XXIX, Fig. 43, ♀.
The species is found from New England and Canada southward to the Carolinas and westward to Kansas. The larva feeds on the Rosaceæ. The insect is very common in Pennsylvania, Ohio, and Indiana.

Genus TORNACONTIA Smith

Two species have been attributed to this genus. One of them, which received the specific name sutrix at the hands of Grote, is represented in the annexed cut.

It was drawn by Mrs. Beutenmüller from a specimen in the collection of the United States Museum of Natural History in New York. The insect is found in the region of the Rocky Mountains.
Genus THERASEA Grote

This is a small genus, represented in our fauna by two species.
(1) Therasea flavicosta Smith, Plate XXIX, Fig. 47, ♂.
The moth occurs in the region of the Rocky Mountains.

Genus TARACHE Hübner

The genus is found in both hemispheres. It is well represented in our fauna, thirty-five species being known to occur within the limits of the United States and Canada. Eleven of these are figured upon our plates.

(1) Tarache terminimacula Grote, Plate XXIX, Fig. 46, ♀.
The species ranges from Massachusetts to Illinois.
(2) Tarache delecta Walker, Plate XXIX, Fig. 48, ♀.
Syn. metallica Grote.
The range of this species is along the Atlantic coast. It occurs in the salt-marshes on Long Island and New Jersey, and ranges thence southward to Texas.
(3) Tarache flavipennis Grote, Plate XXIX, Fig. 52, ♂.
The habitat of this species is the Pacific coast.
(4) Tarache lactipennis Harvey, Plate XXIX, Fig. 45, ♀.
Not at all an uncommon species in Texas.
(5) Tarache lanceolata Grote, Plate XXIX, Fig. 49, ♂.
This species, like the preceding, occurs in Texas.
(6) Tarache sedata Henry Edwards, Plate XXIX, Fig. 53 ♂.
The habitat of this insect is Arizona.
(7) Tarache aprica Hübner, Plate XXIX, Fig. 50, ♂.
The range of this species is from the valley of the Ohio southward to Texas and westward to Colorado.
(8) Tarache erastrioides Guenée, Plate XXIX, Fig. 54, ♀.
The moth is found in New England and Canada and southward so far as West Virginia and Indiana.
(9) Tarache virginalis Grote, Plate XXIX, Fig. 51, ♀.
The habitat of the species is from Kansas to Arizona.
(10) Tarache binocula Grote, Plate XXIX, Fig. 44, ♂.
The range of this species is the same as that of the preceding.
(11) Tarache libedis Smith, Plate XXIX, Fig. 55, ♂.
The home of this insect is New Mexico and Colorado.
Noctuidae

Genus FRUVA Grote

The species belonging to this genus are southern and south-western in their distribution. Six are known.

(1) Fruva apicella Grote, Plate XXIX, Fig. 56, ♂ .
Syn. truncatula Zeller; accepta Henry Edwards.
A very common species in the Gulf States.

Genus SPRAGUEIA Grote

A genus of small, but very attractively colored moths, which frequent the flowers of the Compositiae in the later summer.

(1) Spragueia onagrus Guenee, Plate XXIX, Fig. 57, ♂ .
The moth occurs quite abundantly in southwestern Pennsylvania and the valley of the Ohio, and ranges thence southwardly.
It is common on the blossoms of the golden-rod (Solidago.)
(2) Spragueia plumbifimbriata Grote, Plate XXIX, Fig. 58, ♂ .
This modestly colored species is found in Texas.
(3) Spragueia dama Guenee, Plate XXIX, Fig. 59, ♂ .
Syn. trifariana Walker.
This is a common species in the southern States.
(4) Spragueia guttata Grote, Plate XXIX, Fig. 60, ♂ .
This pretty moth ranges from Texas to Costa Rica.

Genus CALLOPISTRIA Hübner

(1) Callopistria floridensis Guenee, Plate XXIX, Fig. 61, ♂ .
As the name indicates, the species is from Florida.

Genus METATHORASA Moore

A genus represented in both hemispheres, and particularly well in Asia.

(1) Metathorasa monetifera Guenee, Plate XXIX, Fig. 62, ♀ .
A native of the Appalachian subregion, ranging from Canada to Florida. Thus far it does not appear to have been reported from any locality west of the Allegheny Mountains. I found it one summer quite abundantly at Saratoga, New York.
Explanation of Plate XXIX

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Eudonia cinerea Gueneé, ♀.
2. Pectes pygmea Hubner, ♂.
3. Pectes abrostoloides Gueneé, ♀.
4. Pectes occulatrix Gueneé, ♀.
   Merrick Collection.
5. Marasmalus ventilator Grote, ♀.
7. Amyna octo Gueneé, ♀, U.S.N.M.
8. Pierothelyx ballula Grote, ♂, U.
   S. N. M.
10. Alabama argillacea Hubner, ♂.
11. Anomis eosa Hübner, ♀.
12. Anomiafessa Grote, ♀, U.S.N.M.
13. Rivula propinqualis Gueneé, ♀.
16. Annaphila diversa Grote, ♂.
17. Annaphila lithosina Henry Edwards, ♀.
18. Eustrotia albidula Gueneé, ♀.
22. Eustrotia muscosula Gueneé, ♀.
23. Eustrotia apicosa Haworth, ♂.
24. Eustrotia carnea Gueneé, ♀.
25. Azenia implora Grote, ♀.
26. Lithacodia bellicula Hübner, ♂.
27. Galgula hepata Gueneé, ♂.
28. Galgula hepata var. partita Gueneé, ♂.
29. Xanthoptera nigrosimbria Gueneé, ♂.
30. Xanthoptera semiflava Gueneé, ♂.
31. Exyra semicrocea Gueneé, ♀, U. S. N. M.
32. Prothymia semipurpurea Walker, ♀, Merrick Collection.
33. Prothymia orgyia Grote, ♂.
34. Prothymia rhodaria Walker, ♀.
35. Eunestletta flaminicincta Walker, ♀.
37. Metaponia obtusa Herrich-Schaeffer, ♀.
38. Metaponia perlava Harvey, ♀.
40. Tarache binoculata Grote, ♂.
41. Tarache lactipennis Harvey, ♀.
42. Tarache terminimaculata Grote, ♀.
43. Therasea flavicosta Smith, ♂.
44. Tarache delicta Walker, ♀.
45. Tarache lanceolata Grote, ♂.
46. Tarache aprica Hübner, ♀.
47. Tarache virginalis Grote, ♀.
48. Tarache flavipennis Grote, ♂.
49. Tarache sedata Henry Edwards, ♂.
50. Tarache erastrioides Gueneé, ♀.
51. Tarache libedis Smith, ♂.
52. Fraca apicella Grote, ♀.
53. Spragueia onagrus Gueneé, ♂.
54. Spragueia plumbofimbriata Grote, ♀.
55. Spragueia dama Gueneé, ♂.
56. Spragueia gutata Grote, ♀.
57. Calloptria floridensis Gueneé, ♀, U. S. N. M.
58. Xanthoptera mimosa Stretch, ♂.
59. Xanthoptera aurivitta Grote & Robinson, ♂.
60. Cylidae semicosta Grote, ♀.
61. Cylidae aurivitta Grote & Robinson, ♂.
63. Cylidae stellata Walker, ♂.
64. Derrina stellata Walker, ♂.
Genus EUHERRICHIA Grote

A small genus represented by three species in our fauna. *Euherrichia granilosa* occurs in Florida; *Euherrichia cervina* on the Pacific slope; and the species, which we figure, from Canada to Florida and westward to Colorado.

(1) *Euherrichia mollissima* Guenée, Plate XXIX, Fig. 63, ♂. Syn. *rubicunda* Walker.

The specimen depicted was taken in the neighborhood of Saratoga, N. Y.

Genus CYDOSIA Westwood

A small genus represented in our fauna by three species, all of which we figure. The larva pupates in a small cocoon made of strands of silk woven into the form of a globular basket with open meshes, which is suspended from the under side of a leaf by a long cord.

(1) *Cydosia imitella* Stretch, Plate XXIX, Fig. 64, ♂.

The moth is found in the southern States.

(2) *Cydosia aurivitta* Grote & Robinson, Plate XXIX, Fig. 65, ♂.

The species occurs in Florida.

(3) *Cydosia majuscula* Henry Edwards, Plate XXIX, Fig. 66, ♀.

The habitat of the insect is the same as that of the species last mentioned.

Genus CERATHOSIA Smith

The only species of the genus was named *tricolor* by Smith. The fore wings are pure white, spotted with black, the hind wings are pale yellow. The habitat of the species is Texas.

Genus HORMOSCHISTA Mœschler

The only species of this genus, which occurs within our territory, was originally described by Mœschler from Porto Rico. It is found in Florida and elsewhere along the borders of the Gulf of Mexico.
Noctuidæ

Genus PHALÆNOSTOLA Grote

There is only one species of the genus known to occur within our territory.

(1) Phalaenostola larentioides Grote, Plate XXX, Fig. 1, ♀.

The insect ranges from New York southward to the Carolinas and westward to Missouri.

Genus PANGRAPTA Hübner

(1) Pangrapta decoralis Hübner, Plate XXX, Fig. 3, ♀.

Syn. geometroides Guenee; epionoides Guenee; elegantalis Fitch; recusans Walker.

The moth occurs from Nova Scotia to Florida and westward to the Mississippi.

Genus SYLECTRA Hübner

There is only one species of this genus which occurs within the faunal limits covered by this book. It was originally named erycata by Cramer. Subsequently Hübner applied to it the specific name mirandalis, which, of course, falls as a synonym. It is found in Florida, and is also quite common in the entire equatorial belt of South America. The peculiarly scalloped wings and the nodose antennæ serve to readily distinguish the insect, and it is not likely to be confounded with any other. The ground-color of the wings is luteous, variegated with reddish ochraceous.

Genus HYAMIA Walker

Three species of the genus are accredited to our fauna. Of these we figure two.

(1) Hyamia sexpunctata Grote, Plate XXX, Fig. 2, ♂.

The insect ranges from Massachusetts to Texas.

(2) Hyamia perditalis Walker, Plate XXX, Fig. 4, ♀.

Syn. semilineata Walker; umbrijascia Grote.

The range of this moth is the same as that of the preceding species. It is not uncommon in western Pennsylvania.
Genus MELANOMMA Grote

This is another genus of which we know but the one species in our territory. It received the specific name auricinctaria from Mr. Grote, who first described it. It occurs in the southern Atlantic States. The annexed figure is drawn from the type which is preserved in the British Museum.

Genus ARGILLOPHORA Grote

The sole representant of this species is shown in the annexed cut, which was prepared for this book by Mr. Horace Knight from the type, access to which was kindly given by Sir George F. Hampson. The insect was originally reported from Alabama, but is still rare in collections. It probably has a wide range.

Genus PARORA Smith

The sole species belonging to this genus was originally described by Prof. J. B. Smith, from Texas. The accompanying cut shows a figure of the type, which is preserved in the United States National Museum. The ground-color of the wings is pale reddish ochraceous. The moth is found in Texas.
Noctuidae

Genus HOMOPYRALIS Grote

Five species belong to this genus. We figure one of the commoner of these as representative. They come freely to sugar.

(1) Homopyralis contracta Walker, Plate, XXX, Fig. 5, ♀. Syn. zonata Walker; tactus Grote.
The insect is widely distributed all over the Appalachian subregion.

Genus ISOGONA Guenée

(1) Isogona natatrix Guenée, Plate XXXVII, Fig. 18, ♀. Syn. tenuis Grote.
The moth occurs in the southern Atlantic States.

Genus HYPSOROPHA Hübner

(1) Hypsoropha monilis Fabricius, Plate XXX, Fig. 6, ♂.
The species is quite abundant in northern Florida in the spring of the year. It ranges westward and northward as far as Kansas.

(2) Hypsoropha hormos Hübner, Plate XXX, Fig. 7, ♀.
The moth occurs from New York to Texas, and is not uncommon in the eastern half of the valley of the Mississippi.

Genus CISSUSA Walker

Ten species are attributed to this genus in the latest Catalogue of the moths of North America. They are all western and southwestern species. We have selected three of them for purposes of illustration.

(1) Cissusa spadix Cramer, Plate XXX, Fig. 9, ♂. Syn. vegeta Morrison.
The species occurs in the southwestern portions of the United States.

(2) Cissusa inepta Henry Edwards, Plate XXX, Fig. 10, ♂. Syn. morbosa Henry Edwards.
The moth flies in Colorado.

(3) Cissusa sabulosa Henry Edwards, Plate XXX, Fig. 11, ♀. The habitat of this insect is the same as that of the preceding species.

256
Genus **ULOSYNEDA** Smith

The only species of this genus was named *valens* by Henry Edwards. It is represented on Plate XXX, Fig. 12, by a specimen of the male sex. Its home is Colorado, Wyoming, and Utah.

Genus **DRASTERIA** Hübner

A widely distributed genus containing four species, which are peculiar to our fauna. All of these are figured on our plates.

(1) **Drasteria erechtea** Cramer, Plate XXX, Fig. 14, ♀.

*Syn. sobria* Walker; *narrata* Walker; *patibilis* Walker; *agricola* Grote & Robinson; *mundula* Grote & Robinson.

This is a very common species widely distributed from Canada to Florida and westward as far as Colorado and Wyoming. It frequents grassy places and may be found from April to October.

(2) **Drasteria crassiuscula** Haworth, Plate XXX, Fig. 15, ♂.

*Syn. erichto* Gueneé.

Quite as common as the preceding species, and having the same general distribution.

(3) **Drasteria caerulea** Grote, Plate XXX, Fig. 13, ♂.

*Syn. aquamarina* Felder.

The habitat of this pretty species is the Pacific coast. It is one of the very few blue moths which are known.

(4) **Drasteria conspicua** Smith, Plate XXX, Fig. 16, ♂.

This elegant moth is a native of Alberta and the adjacent territories of the British possessions.

Genus **CAENURGIA** Walker

(1) **Caenurgia convalescens** Guenée, Plate XXX, Fig. 17, ♂.

*Syn. socors* Walker; *purgata* Walker.

The range of this insect is from Canada to Florida and westward to the Mississippi.

(2) **Caenurgia adversa** Grote, Plate XXX, Fig. 18, ♂.

The habitat of the species is California.

Genus **EUCLIDIA** Ochsenheimer

We show two of the four species which are known to occur within our faunal limits.
Noctuidæ

(1) Euclidia cuspidea Hübner, Plate XXX, Fig. 20, ♀.
The moth is found from Canada to the Carolinas and Georgia and thence westward to the Mississippi.

(2) Euclidia intercalaris Grote, Plate XXX, Fig. 19, ♂.
This is a rather rare species in collections. It is found in New Mexico and the southwestern States.

Genus PANULA Guenée

(1) Panula inconstans, Plate XXX, Fig. 21, ♂.
Not uncommon in the southern States.

Genus MELIPOTIS Hübner

This is a moderately large genus, represented in both the New World and the Old. Of the ten species known to occur within our faunal limits we show six on our plates.

(1) Melipotis fasciolaris Hübner, Plate XXX, Fig. 22, ♀.
This is not an uncommon insect in the Antilles, and also occurs in Florida. The specimen figured on the plate was taken in the latter locality.

(2) Melipotis pallescens Grote & Robinson, Plate XXX, Fig. 25, ♀.
An inhabitant of the southwestern portions of our territory, reported from Colorado, New Mexico, Texas, and Arizona.

(3) Melipotis limbolaris Geyer, Plate XXX, Fig. 27, ♂.
Syn. grandirena Haworth.
Found from New England to Florida and westward to the Mississippi.

(4) Melipotis perlæta Henry Edwards, Plate XXX, Fig. 26, ♀.
The species has been found in Arizona and Texas.

(5) Melipotis jucunda Hübner, Plate XXX, Fig. 24, ♂.
Syn. cinis Guenée; agrotipennis Harvey; hadeniformis Behr.
The insect ranges from New York to Florida and westward to Texas and Colorado.

(6) Melipotis sinualis Harvey, Plate XXX, Fig. 23, ♀.
This easily recognizable species is an inhabitant of Texas and Arizona and ranges southward along the high table-lands of northern Mexico.

258
Genus CIRRHOBOLINA Grote

(1) Cirrhobolina deducta Morrison, Plate XXX, Fig. 36, ♂.
Syn. pavitensis Morrison.
A common insect in Texas.
(2) Cirrhobolina mexicana Behr, Plate XXX, Fig. 28, ♀.
Syn. incandescens Grote.
The moth occurs quite commonly in the southwestern portions of our territory from Colorado to Arizona and Texas, and thence southward on the Mexican plateaus.

Genus SYNEDA Guenee

Twenty-five species are attributed to this genus and indicated as having their habitat within the territory with which this book deals. It is possible that a final revision of the genus will lead to the discovery that some of the so-called species are merely local races or varietal forms of others. There is considerable dissimilarity between the sexes in some of the species, and it may be that there is in this fact also an element of confusion. The species which are figured on the plates are such as are for the most part well known and the identification of which is certain.

(1) Syneda graphica Hübner, Plate XXX, Fig. 30, ♂.
Syn. capticola Walker.
The insect ranges from New York to Florida westward to the Alleghany Mountains.
(2) Syneda divergens Behr, Plate XXX, Fig. 32, ♂.
The insect is western and has an ascertained range from Colorado to California.
(3) Syneda alleni Grote, Plate XXX, Fig. 35, ♂.
Syn. saxea Henry Edwards.
The species has a northern range and is reported from Maine and Canada, Manitoba and Montana. It extends its habitat southward along the elevated table-lands of the continent to Colorado and Wyoming.
(4) Syneda adumbrata Behr, Plate XXX, Fig. 34, ♂.
This is a western species ranging from Montana and Arizona in the east to the Pacific.
(5) Syneda socia Behr, Plate XXX, Fig. 38, ♂.
The range of this species is practically the same as that of the last mentioned.

259
Noctuidae

(6) Syneda howlandi Grote, Plate XXX, Fig. 33, ♂.
   Syn. stretchi Behr.
   The insect is distributed from Colorado and Arizona westward to California.

(7) Syneda edwardsi Behr, Plate XXX, Fig. 37, ♀.
   The moth is thus far known only from California.

(8) Syneda hudsonica Grote & Robinson, Plate XXX, Fig. 31, ♂.
   This is a northern species, ranging from Ontario westward to Montana.

(9) Syneda athabasca Neumoegen, Plate XXX, Fig. 29, ♂.
   The moth has been taken in considerable numbers in Alberta and Assiniboia, and is also reported as occurring in British Columbia.

Genus CATOCALA Schrank

This is a very large genus represented in both hemispheres. The metropolis of the genus appears to be North America; at all events, there are more species found in our territory than occur elsewhere, though in eastern Asia and temperate Europe the genus is very well represented by many strikingly beautiful forms. There is considerable variation in the case of some of the species, and as they have always been favorites with collectors, a great deal has been written upon them, and many varietal names have been suggested. Over one hundred species are attributed to our fauna. Of these the majority are figured in our plates. We follow the order of arrangement given in Dyar's List of North American Lepidoptera.

(1) Catocala epione Drury, Plate XXXI, Fig. 3, ♀. (The Epione Underwing.)
   The insect is distributed from New England and Canada southward to the Carolinas and westward to Missouri and Iowa.

(2) Catocala sappho Strecker, Plate XXXI, Fig. 2, ♂. (The Sappho Underwing.)
   This rare species has been found from western Pennsylvania and West Virginia as far west as Illinois and as far south as Texas.

(3) Catocala agrippina Strecker, Plate XXXI, Fig. 1, ♀. (The Agrippina Underwing.)
   The species occurs from New York and the region of the Great Lakes southward to Texas.

260
Explanation of Plate XXX

(Except when otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Phaleno stola larentioides Grote, ♀.
2. Hyamia sexpunctata Grote, ♂.
3. Pangrapta decoralis Hübner, ♀.
5. Homopyralis contracta Walker, ♀.
6. Hypsoropha monilis Fabricius, ♀.
8. Hyblea puera Cramer, ♀, U. S. N. M.
15. Drasteria crassiuscula Haworth, ♀.
16. Drasteria conspicua Smith, ♀.
17. Canurgia convalescens Guenée, ♀.
18. Canurgia adversa Grote, ♀.
19. Euclidia intercalaris Grote, ♀.
20. Euclidia cuspidea Hübner, ♀.
22. Melipotis fasciolaris Hübner, ♀.
23. Melipotis sinuatais Harvey, ♀.
24. Melipotis jucunda Hübner, ♀.
27. Melipotis limbolaris Geyer, ♀.
28. Cirrhobolina mexicana Behr, ♀.
29. Syneda athabasca Neumann, ♀.
30. Syneda graphica Hubner, ♀.
31. Syneda hudsonica Grote & Robinson, ♀.
32. Syneda divergens Behr, ♀.
33. Syneda howlandi Grote, ♀.
34. Syneda adunbrata Behr, ♀.
35. Syneda allenii Grote, ♀.
36. Cirrhobolina deducta Morrison, ♀.
37. Syneda edwardsi Behr, ♀.
38. Syneda socia Behr, ♀.
39. Litocala sexsignata Harvey, ♀.
40. Hypocala andremona Cramer, ♀.
41. Agnomonia anilis Drury, ♀.
42. Epidromia delinquens Walker, ♀.
Noctuidae

(4) **Catocala subviridis** Harvey, Plate XXXI, Fig. 4, ♂.
(The Faintly Green Underwing.)

The insect has been by some writers regarded as a variety of the preceding species. It is characterized by larger size, and brighter colored fore wings, on which the maculation is much more distinct. In certain lights there is a pronounced greenish shade visible upon the wings.

(5) **Catocala lacrymosa** Guenée, Plate XXXI, Fig. 6, ♂.
(The Tearful Underwing.)

Form **paulina** Henry Edwards, Plate XXXI, Fig. 12, ♀.
(The Paulina Underwing.)

Form **evelina** French, Plate XXXI, Fig. 9, ♀. (The Evelina Underwing.)

The range of this variable species is practically the same as that of the last mentioned.

(6) **Catocala viduata** Guenée, Plate XXXI, Fig. 15, ♀. (The Widowed Underwing.)

Syn. *maestosa* Hulst; *guenei* Grote.

The metropolis of this species appears to be the Gulf States. It is abundant in Texas.

(7) **Catocala vidua** Abbot & Smith, Plate XXXI, Fig. 5, ♂.
(The Widow Underwing.)

Syn. *desperata* Guenée.

The insect ranges from Canada to Florida through the Appalachian subregion.

(8) **Catocala dejecta** Strecker, Plate XXXII, Fig. 1, ♂.
(The Dejected Underwing.)

The species is found in the northern portions of the Atlantic subregion.

Form **carolina** *subsp. nov.*, Plate XXXII, Fig. 5, ♂. (Carrie's Underwing.)

This insect, which occurs in western Pennsylvania, appears to be a form of *dejecta*, having the same relation to that species as that which is held by *basalis* to *habilis*. It is characterized by its smaller size, and by the black stripe which runs from the base of the wing to the apex, giving it quite a different facies from *dejecta*. The type is figured upon our plate, and it may from the illustration easily be recognized.
Noctuidae

(9) Catocala retecta Grote, Plate XXXI, Fig. 8, ♀. (The Yellow-Gray Underwing.)
The moth is found from Canada to the Carolinas and westward to the Mississippi.

(10) Catocala flebilis Grote, Plate XXXI, Fig. 11, ♂. (The Mourning Underwing.)
The habitat of this species is the same as that of the last mentioned.

(11) Catocala robinsoni Grote, Plate XXXI, Fig. 7, ♀. (Robinson’s Underwing.)
The moth ranges from New England to the Mississippi and southward to Tennessee and the Carolinas. It is particularly abundant in the Ohio valley.

(12) Catocala obscura Strecker, Plate XXXI, Fig. 14, ♂. (The Obscure Underwing.)
The moth may be found from Canada to Maryland and westward to Colorado.

(13) Catocala insolabilis Guenée, Plate XXXI, Fig. 10, ♀. (The Inconsolable Underwing.)
The species is found from Canada southward to the Carolinas and westward to the Mississippi.

(14) Catocala angusi Grote, Plate XXXI, Fig. 13, ♂. (Angus’ Underwing.)
The range of this species is the same as that of the preceding.

(15) Catocala judith Strecker, Plate XXXII, Fig. 2, ♂. (The Judith Underwing.)
The insect occurs from New England westward in the northern portions of the Atlantic subregion.

(16) Catocala tristis Edwards, Plate XXXII, Fig. 3, ♂. (The Gloomy Underwing.)
The species appears to be commoner in New England than elsewhere.

(17) Catocala relict a Walker, Plate XXXII, Fig. 6, ♀. (The Relict.)
Form bianca Henry Edwards, Plate XXXII, Fig. 7, ♂. (The Bianca Underwing.)
This fine moth is found in the northern portions of the Appalachian subregion. It is not uncommon in New England and
Explanation of Plate XXXI

(The specimens figured are contained in the collection of W. J. Holland.)

1. Catocala agrippina Streeker, ♂.
2. Catocala sappho Streeker, ♀.
3. Catocala epione Drury, ♂.
4. Catocala subviridis Harvey, ♂.
5. Catocala vidua Abbot & Smith, ♂.
6. Catocala lacrymosa Guenée, ♂.
7. Catocala robinsoni Grote, ♀.
8. Catocala recta Grote, ♂.
9. Catocala lacrymosa var. evelina, French, ♀.
11. Catocala flebilis Grote, ♀.
13. Catocala angusi Grote, ♂.
15. Catocala viduata Guenée, ♀.
northern New York, but it is rare in western Pennsylvania. It has a westward range to Colorado and Oregon.

(18) *Catocala cara* Guenée, Plate XXXII, Fig. 9, ♂. (The Darling Underwing.)

This large and splendid species is a native of the Appalachian subregion, and in it has a wide range.

(19) *Catocala amatrix* Hübner, Plate XXXII, Fig. 12, ♂. (The Sweetheart.)

Form *nurus* Walker, Plate XXXII, Fig. 13, ♀. (The Nurse.)

This is another fine species, which has the same geographical distribution as the last mentioned.

(20) *Catocala marmorata* Edwards, Plate XXXV, Fig. 9, ♀. (The Marbled Underwing.)

This is a rather rare species, which has a wide distribution. Its metropolis appears to be West Virginia and Kentucky, though it has been taken elsewhere.

(21) *Catocala concumbens* Walker, Plate XXXV, Fig. 10, ♂. (The Sleepy Underwing.)

This lovely moth has a wide range in the Appalachian sub-region. It is very common in New England and central New York, less common in western Pennsylvania.

(22) *Catocala californica* Edwards, Plate XXXIII, Fig. 1, ♀. (The California Underwing.)

As the name implies, the species is a native of California.

(23) *Catocala cleopatra* Henry Edwards, Plate XXXV, Fig. 14, ♀. (The Cleopatra Underwing.)

This insect is regarded by some as a varietal form of the preceding species. It has the same habitat.

(24) *Catocala luciana* Henry Edwards, Plate XXXV, Fig. 11, ♂. (The Luciana Underwing.)

Syn. *nebraskae* Dodge.

Form *somnus* Dodge, Plate XXXV, Fig. 16, ♀.

The moth is found in Kansas, Nebraska, Colorado, and Wyoming.

(25) *Catocala babayaga* Strecker, Plate XXXV, Fig. 18, ♂. (The Babayaga Underwing.)

The habitat of the species is Arizona.

(26) *Catocala stretchi* Behr, Plate XXXV, Fig. 13, ♂. (Stretch's Underwing.) The species is Californian.
Noctuidae

(27) **Catocala augusta** Henry Edwards, Plate XXXIII, Fig. 8, ♂. (The Augusta Underwing.)

Like the preceding species, this is also confined in its range to the Pacific coast.

(28) **Catocala rosalinda** Henry Edwards, Plate XXXV, Fig. 15, ♂. (The Rosalind Underwing.)

The insect has been found in Kansas and Colorado.

(29) **Catocala pura** Hulst, Plate XXXV, Fig. 17, ♂. (The Pure Underwing.)

The moth is an inhabitant of the region of the Rocky Mountains.

(30) **Catocala unijuga** Walker, Plate XXXIII, Fig. 5, ♀. (The Once-married Underwing.)

This is a widely distributed species, the range of which is northern, extending from New England to Colorado, through Canada and the region of the Great Lakes. It is common in central New York.

(31) **Catocala meskei** Grote, Plate XXXIII, Fig. 6, ♂. (Meske’s Underwing.)

By some students this species has been regarded as a variety of the preceding. Its range is the same.

(32) **Catocala groteiana** Bailey, Plate XXXII, Fig. 4, ♂. (Grote’s Underwing.)

The moth occurs from Canada to New Mexico, and has been sometimes treated as a variety of *Catocala briseis* Edwards.

(33) **Catocala hermia** Henry Edwards, Plate XXXVI, Fig. 7, ♀. (The Hermia Underwing.)

The habitat of the species is Colorado and New Mexico.

(34) **Catocala briseis** Edwards, Plate XXXV, Fig. 12 ♂. (The Briseis Underwing.)

The species is an inhabitant of the northern portions of the Appalachian subregion, and is also known to occur in Colorado.

(35) **Catocala faustina** Strecker, Plate XXXIII, Fig. 3, ♂. (The Faustina Underwing.)

The specimen figured on the plate was received by the writer from the author of the species, and may be accepted as typical. The range of the moth is from Colorado to California.

(36) **Catocala parta** Guenée, Plate XXXIV, Fig. 11, ♂. (The Mother Underwing.)
This fine species is quite common in the Appalachian sub-region and ranges northward into the region of Hudson Bay and westward as far as Colorado.

(37) _Catocala coccinata_ Grote, Plate XXXIV, Fig. 10, ♂. (The Scarlet Underwing.)

The moth is recorded as occurring from Canada to Florida and Texas, and westward to the Mississippi. It is not very common.

(38) _Catocala aholibah_ Strecker, Plate XXXIV, Fig. 15, ♀. (The Aholibah Underwing.)

The specimen figured on the plate was obtained from the author of the species, and may be accepted as typical. The insect is found from New Mexico and Colorado to California and Oregon.

(39) _Catocala verrilliana_ Grote, Plate XXXIV, Fig. 16, ♂. (Verrill's Underwing.)

A neat and prettily marked species which has much the same range as the preceding, though extending somewhat farther to the south.

(40) _Catocala ultronia_ Hübner, Plate XXXIII, Fig. 2, ♂. (The Ultronia Underwing.)

Form _celia_ Henry Edwards, Plate XXXIII, Fig. 4, ♂. (The Celia Underwing.)

Form _mopsa_ Henry Edwards, Plate XXXIII, Fig. 7, ♂. (The Mopsa Underwing.)

Besides the three forms of this variable species which we have selected for illustration, there are several others which have received subspecific names. The insect is very common, and occurs from the Atlantic to the Great Plains and from Canada to Florida.

(41) _Catocala ilia_ Cramer, Plate XXXIV, Fig. 14, ♂. (The Ilia Underwing.)

Form _uxor_ Guenée, Plate XXXIV, Fig. 17, ♀. (The Wife.)

Form _osculata_ Hulst, Plate XXXIV, Fig. 7, ♂. (The Beloved Underwing.)

This is a common and variable species which is found generally throughout the United States and Canada.

(42) _Catocala innubens_ Guenée, Plate XXXIII, Fig. 13, ♂; Plate I, Fig. 7, larva. (The Betrothed.)
Form hinda French, Plate XXXIII, Fig. 10, ♂. (The Hinda Underwing.)

Form scintillans Grote, Plate XXXIII, Fig. 9, ♂. (The Glittering Underwing.)

This is another very common and very variable species, which is found from Canada to the Carolinas and westward to the Mississippi.

(43) Catocala nebulosa Edwards, Plate XXXIII, Fig. 16, ♀. (The Clouded Underwing.)

This fine species is found in the Middle Atlantic and Central States east of the Mississippi. It appears to be quite common in southern Indiana.

(44) Catocala piatrix Grote, Plate XXXVI, Fig. 6, ♂. (The Penitent.)

The moth is found throughout the United States east of the Rocky Mountains, and as far south as Arizona. It is a common species.

(45) Catocala neogama Abbot & Smith, Plate XXXVI, Fig. 5, ♀. (The Bride.)

This is another common and variable species which has the same geographical distribution as that of the last-named insect.

(46) Catocala subnata Grote, Plate XXXIII, Fig. 15, ♀. (The Youthful Underwing.)

The species is found in the Appalachian subregion, and appears to be not uncommon in Kentucky and southern Indiana.

(47) Catocala cerogama Guenée, Plate XXXIV, Fig. 6, ♂. (The Yellow-banded Underwing.)

Syn. aurella Fisher; eliza Fisher.

This is a common species ranging from Canada to the Carolinas and westward to the Mississippi.

(48) Catocala palæogama Guenée, Plate XXXVI, Fig. 3, ♂. (The Oldwife Underwing.)

Form phalanga Grote, Plate XXXVI, Fig. 4, ♂. (The Phalanga Underwing.)

The moth ranges from New England to Virginia and westward to the Mississippi.

(49) Catocala consors Abbot & Smith, Plate XXXIV, Fig. 3, ♂. (The Consort.)
Explaination of Plate XXXII

(The specimens figured are contained in the collection of W. J Holland.)

1. Catocala dejecta Strecker, ♂.
2. Catocala judith Strecker, ♂.
5. Catocala carolina Holland, ♂.
7. Catocala relicta var. bianca Henry Edwards, ♂.
8. Catocala antinympha Hübner, ♂.
11. Catocala muliercula Guenée, ♂.
12. Catocala amatrix Hübner, ♂.
13. Catocala amatrix var. nurus Walker, ♀.
15. Catocala alabama Grote, ♀.
18. Catocala celebs Grote, ♂.
20. Catocala nerissa Henry Edwards, ♀
The insect is found from Pennsylvania southward and westward to Texas.

(56) Catocala muliercula Guenée, Plate XXXII, Fig. 11, ♂. (The Little Wife.)
The insect is an inhabitant of the central portions of the Appalachian subregion.

(51) Catocala delilah Strecker, Plate XXXIV, Fig. 4, ♀. (The Delilah Underwing.)
Syn. adoptiva Grote.
The range of this species is from southern Illinois and Kentucky southward to the Gulf and westward to Kansas and Nebraska.

(52) Catocala desdemona Henry Edwards, Plate XXXIV, Fig. 5, ♂. (The Desdemona Underwing.)
The species is found in the southwestern States.

(53) Catocala andromache Henry Edwards, Plate XXXIV, Fig. 2, ♂. (The Andromache Underwing.)
This species is found in southern California and Arizona. I am indebted to Mr. O. C. Poling for the fine specimen of this rare moth which is figured upon the plate. It is closely allied to the preceding species.

(54) Catocala illecta Walker, Plate XXXIV, Fig. 1, ♂. (The Magdalen Underwing.)
Syn. magdalena Strecker.
The moth is found from Indiana to Nebraska and southward to Texas.

(55) Catocala serena Edwards, Plate XXXIII, Fig. 14, ♂. (The Serene Underwing.)
The insect ranges from Canada and New England westward into the valley of the Mississippi. It is said to also occur in eastern Siberia, but this is doubtful.

(56) Catocala antinympha Hübner, Plate XXXII, Fig. 8, ♂. (The Wayward Nymph.)
The moth is reported from Canada to Maryland and westward as far as the Mississippi. I have found it very abundant at Saratoga, N. Y., and even more abundant on the summits of the Allegheny Mountains about Cresson Springs in the month of August.

(57) Catocala badia Grote & Robinson, Plate XXXII, Fig. 10, ♀. (The Badia Underwing.)
Noctuidæ

The species is more common in New England than elsewhere. It is rather abundant on the north shore of Massachusetts Bay, and occurs also in central New York and the Adirondacks. I have never known it to be taken in western Pennsylvania.

(58) **Catocala cœlebs** Grote, Plate XXXII, Fig. 18, ♂ . (The Old-maid.)

The range of this species, which is by some students regarded as a varietal form of the preceding, is from southern Canada through New England into central New York.

(59) **Catocala habilis** Grote, Plate XXXIII, Fig. 11, ♂ .

**Form basalis** Grote, Plate XXXIII, Fig. 12, ♂ .

The moth occurs from Canada to Virginia and westward to the Mississippi. The form *basalis* has a black longitudinal streak from the base of the fore wing along the lower side of the cell.

(60) **Catocala abbreviatella** Grote, Plate XXXIV, Fig. 9, ♀ .

The insect occurs from Minnesota and Illinois southward to Texas and westward to Utah.

(61) **Catocala whitneyi** Dodge, Plate XXXIV, Fig. 8, ♂ . (Whitney's Underwing.)

The moth, which is probably only a varietal form of the preceding species, has the same range. The specimen figured on the plate was received from the author of the species.

(62) **Catocala polygama** Guenée, Plate XXXIV, Fig. 13, ♂ . (The Polygamist.)

**Form crataegi** Saunders, Plate XXXIV, Fig. 12, ♂ . (The Hawthorn Underwing.)

A common and variable species ranging all over the Appalachian subregion.

(63) **Catocala amasia** Abbot & Smith, Plate XXXV, Fig. 1, ♂ . (The Amasia Underwing.)

**Syn. sancta** Hulst.

The geographical range of the species is from New York and Illinois southward to the Gulf of Mexico.

(64) **Catocala similis** Edwards, Plate XXXV, Fig. 2, ♂ .

**Syn. formula** Grote.

**Form aholah** Streecker, Plate XXXV, Fig. 3, ♂ .

The moth occurs from Rhode Island to Texas. It is a widely distributed but not very common species.
Explanation of Plate XXXIII

(The specimens figured are contained in the collection of W. J. Holland.)

2. Catocala ultronia Hübner, ♂.
3. Catocala faustina Strecke, ♂.
5. Catocala unijuga Walker, ♀.
6. Catocala meskei Grote, ♂.
11. Catocala habilis Grote, ♂.
12. Catocala basalis Grote, ♂.
13. Catocala innubens Guenée, ♂.
15. Catocala subnata Grote, ♀.
17. Poaphila quadrifilaris Hübner, ♀.
18. Allotria elonympha Hübner, ♂.
(65) **Catocala fratercula** Grote & Robinson, Plate XXXV, Fig. 4, ♂.  (The Little Sister.)  
Form *jaquenetta* Henry Edwards, Plate XXXV, Fig. 5, ♂.  
Form *gisela* Meyer, Plate XXXII, Fig. 21, ♀.

The species is very variable within certain limits, and is widely distributed over the United States and Canada from the Atlantic to the Pacific.

(66) **Catocala olivia** Henry Edwards, Plate XXXII, Fig. 14, ♂.  (The Olivia Underwing.)  
The species is a native of Texas.

(67) **Catocala praeclara** Grote & Robinson, Plate XXXV, Fig. 7, ♂.

The insect belongs within the more northern portions of the Appalachian subregion. The specimen figured was taken in Massachusetts.

(68) **Catocala grynea** Cramer, Plate XXXV, Fig. 6, ♂.  
The moth is found from Canada to the Carolinas and westward to the Mississippi.

(69) **Catocala alabamæ** Grote, Plate XXXII, Fig. 15, ♀.

The habitat of the species is, as indicated by the name, the state of Alabama.

(70) **Catocala gracilis** Edwards, Plate XXXV, Fig. 8, ♀.  (The Graceful Underwing.)  
The species occurs from Canada to the southern States on the Atlantic seaboard and westward to the valley of the Ohio.

(71) **Catocala minuta** Edwards, Plate XXXII, Fig. 17, ♂.  (The Little Underwing.)  
The moth is indigenous in the Eastern and Middle States.

(72) **Catocala amica** Hübner, Plate XXXII, Fig. 16, ♂.  
Form *lineella* Grote, Plate XXXII, Fig. 19, ♂.  
Form *nerissa* Henry Edwards, Plate XXXII, Fig. 20, ♀.

This small species is subject to considerable variation. It has a wide range from Ontario to Texas, and from the Atlantic to the Great Plains.

"Place and time requiring, let this insect fly.  
It hovers round the wick—with the wind of its wings the flame is extinguished."  
*Śūdraka, The Mrichchakati, or, The Toy-cart.*
WALKING AS A FINE ART

The first act of all animals is that of absorption. Feeding is a primal necessity. The senses of smell, of touch, and of taste are involved in it. Sight has little to do with it at first, but is soon awakened. Coincident with this act among the lower animals is that of locomotion. Man, whose desire to annihilate space has become a supreme passion, approaches the act of locomotion later than all other animals. Young ducks and geese fly from the Arctic Circle to Florida a few months after they have been hatched. Babies do not often begin to crawl until they are twice as old, and rarely walk until more than a year of life has been passed. There is nothing more interesting than the sight of a child just beginning to walk. The look of glad surprise and immense satisfaction which is displayed when a few successful steps have been taken is delightful to the observer. The triumphs of the most successful men do not in later years afford them so much momentary pleasure as is experienced by the little fellow who realizes that at last after many failures he has "got his legs."

In much of our going to and fro on this small globe we are aided by adventitious helps. Stephenson, Fulton, and the fathers of the science of magnetism and electricity have done much to pave the way for our rapid transportation from one spot to another. But there are some places to which we cannot be hauled, and we have not yet reached the point where we can dispense with the use of our pedal extremities.

Happy is the man who has acquired the love of walking for its own sake! There is no form of exercise more health-giving, none which tends more thoroughly to invigorate, if it be wisely undertaken. The effect of the act is to quicken the venous circulation; to send the blood to the lungs, there to be purified by contact with the oxygen of the atmosphere; to harden and strengthen the muscles of the legs and to bring those of the arms and the chest into play. People who walk do not have overloaded veins. The shop-girl who stands behind the counter all day suffers from varicosis, but the man or woman who walks avoids it. Standing is harder than walking; it is more fatiguing, and brings no return of health to the system.
Explanation of Plate XXXIV

(The specimens figured are contained in the collection of W. J. Holland.)

4. *Catocala delilah* Streecker, ♀.
8. *Catocala whitneyi* Dodge, ♂.
10. *Catocala coeciniata* Grote, ♂.
15. *Catocala aholidah* Streecker, ♀.
17. *Catocala uxor* Guenée, ♀.
In walking, the best results are secured when there is no burden upon the mind. The man who carries the load of daily care with him when he walks derives less benefit from the act than the man who dismisses all concern and simply gives himself over to the act. It is a mistake to suppose that it is an advantage in walking to have some definite object of pursuit. The woman who is advised by her physician to walk should not select as her path some busy street upon which she is certain to be diverted by the opportunity to unite with her exercise a number of shopping excursions. The man who goes out to walk should not choose a much frequented part of the town where he is sure to meet business friends and acquaintances. The person who desires to derive the best results from his strolls should select a retired spot in park or country where the “madding throng” does not resort. It is hard to make Americans realize the importance of these suggestions. The demand is forever that exercise, if taken at all, shall have an aim ulterior to itself, in the pursuit of which the upbuilding of the system shall take place as a collateral incident. The popularity of golf is due to the fact that it answers the demand of a great class of persons to be amused while they are being invigorated. It is one of the least objectionable forms, in which the pill of exercise is sugar-coated for consumption by a race which is slowly but surely working itself to death in office, mill and factory.

Walking for its own sake is pursued to a far greater extent in England and in Germany than in America. We may well learn to imitate our cousins on the eastern side of the Atlantic in this regard.

If walking is to be pursued with an object, there is nothing which may be chosen as an aim better than the pursuit of that knowledge which is the end of the naturalist. To become acquainted with the fields and the flowers which bloom in them, with the forests and the myriad forms of animate life which frequent them, is an aim which leads far away from the cares and pursuits of the weary, workday world. I met the other day a friend, who, with quick step and alertness depicted in every feature, was hurrying along one of the avenues in the capital. I marveled at his gait, for I knew that the winters of fourscore and five years rested upon his head. "How is it that you have
Walking as a Fine Art

found the fountain of eternal youth?" I said. "My dear boy," he replied, "I have found it by living near to nature’s heart, and by having my beloved science of entomology to refresh and quicken me in my daily walks."

Would you cultivate walking as a fine art, learn to see and to hear what the world, which man has not made nor has entirely marred, is telling you of the wonders of that life which she kindly nourishes upon her bosom.

"Cleon sees no charm in nature—in a daisy, I; Cleon hears no anthem ringing in the sea and the sky, Nature sings to me forever—earnest listener, I; State for state, with all attendants, who would change! Not I."

Genus ALLOTRIA Hübner

(1) Allotria elonympha Hübner, Plate XXXIII, Fig. 18, ♂. This handsome little species is found in the Appalachian sub-region. It is the sole species of the genus.

Genus ANDREWSIA Grote

(1) Andrewsia messalina Guenée, Plate XXXVI, Fig. 1, ♂. Syn. belfragiana Harvey; jocasta Strecker. The insect has been found to range from Kansas to Texas. It appears on the wing in the latter state in May.

Genus EUPARTHENOS Grote

(1) Euparthenos nubilis Hübner, Plate XXXVI, Fig. 2, ♀. The moth occurs from the northern Atlantic States to Arizona.

Genus HYPOCALA Guenée

(1) Hypocala andremona Cramer, Plate XXX, Fig. 40, ♂. Syn. hilli Lintner. The insect is characteristic of the neotropical fauna. It occurs as a straggler into Texas, and is found very commonly throughout Mexico, Central America, and South America.

Genus LITOCALA Harvey

(1) Litocala sexsignata Harvey, Plate XXX, Fig. 39, ♀. The species occurs through the region of the Rocky Mountains to California.
Explanation of Plate XXXV

(The specimens figured are contained in the collection of W. J. Holland.)

1. *Catocala amasia* Abbot & Smith, ♀.
3. *Catocala aholah* Strecker, ♂.
13. *Catocala stretchi* Behr, ♂.
17. *Catocala pura* Hulst, ♂.
18. *Catocala babayaga* Strecker, ♂.
Genus **TOXOCAMPA** Guenée

(1) **Toxocampa victoria** Grote, Plate XXXVI, Fig. 10, ♀.
This is a northern species found from New England to British Columbia and ranging southward along the higher mountain ranges of the west.

Genus **PHOBERIA** Hübner

(1) **Phoberia atomaris** Hübner, Plate XXXVI, Fig. 14, ♂.
Syn. *orthosioides* Guenée; *fornigens* Walker; *ingenua* Walker.
The moth has been taken from Maine to Texas and westward as far as the Great Plains.

Genus **SIAVANA** Walker

(1) **Siavana repanda** Walker, Plate XXXVI, Fig. 15, ♀.
The moth ranges from the Valley of the Ohio southward to the Gulf of Mexico. It is not uncommon in Florida.

Genus **PALINDIA** Guenée

This is an extensive neotropical genus, represented by but two species, which have thus far been taken within our territory.
(1) **Palindia dominicata** Guenée, Plate XXXVI, Fig. 17, ♂.
The moth occasionally occurs in Texas. It is very common in Central and South America.

Genus **PANAPODA** Guenée

(1) **Panapoda rufimargo** Hübner, Plate XXXVI, Fig. 19, ♂.
Syn. *rubricosta* Guenée; *cressoni* Grote.
Form **carnieicosta** Guenée, Plate XXXVI, Fig. 20, ♂.
Syn. *scissa* Walker; *combinata* Walker.
The insect is found through the Appalachian subregion. It is quite common in parts of New England, and at certain times has been taken abundantly in western Pennsylvania.

Genus **PARALLELIA** Hübner

(1) **Parallelia bistriaris** Hübner, Plate XXXVI, Fig. 18, ♂.
The insect occurs from Nova Scotia to Florida and westward to the Rocky Mountains.
Noctuidae

Genus AGNOMONIA Hübner

(1) Agnomonia anilis Drury, Plate XXX, Fig. 41, ♂.
   Syn. sesquistriaris Hübner.
   The moth is found from Pennsylvania to Missouri and Texas. It is common in Florida.

Genus REMIGIA Guenée

(1) Remigia repanda Fabricius, Plate XXXVI, Fig. 16, ♀.
   Syn. latipes Guenée; perlata Walker; indentata Harvey; texana Morrison.
   The species, which is somewhat variable, is said to occur in Labrador, but the writer, though he has at various times received large collections from that country, is not in possession of any direct evidence of the correctness of the statement. The insect does, however, occur in northern Canada and ranges thence southwardly to Argentina, keeping, so far as is known, to the eastern side of the Rocky Mountains and the Andes.

Genus GRAMMODES Guenée

A moderately large genus, which is represented in both hemispheres. Three species occur in our fauna, of which we figure one.

(1) Grammodes smithi Guenée, Plate XXXVI, Fig. 22, ♀.
   The moth occurs in the Gulf States and in Mexico. The specimen figured was taken in southern Texas.

Genus EPIDROMA Guenée

(1) Epidroma delinquens Walker, Plate XXX, Fig. 42, ♀.
   The moth, which is common enough in Central and South America, has recently been found to occur in southern Florida.

Genus POAPHILA Guenée

This is a genus of large size, the insects belonging to which occur in the warmer regions of America. We figure but one of the twelve species, which are attributed to our fauna.

(1) Poaphila quadrifilaris Hübner, Plate XXXIII, Fig. 17, ♀.
   The insect is known to occur from Massachusetts to Florida along the coast.
Genus PHURYS Guenée

Six species occurring within our territory are given as belonging to this genus in the latest list of the lepidoptera of North America. Of these we illustrate two.

(1) Phurys vinculum Guenée, Plate XXXVI, Fig. 12, ♂.
The species occurs in the Gulf States and southward.

(2) Phurys lima Guenée, Plate XXXVI, Fig 11, ♂.
The range of this insect is the same as that of the preceding species. It may be easily distinguished by the presence of the small round dark dot near the base of the fore wings on the inner margin.

Genus CELIPTERA Guenée

(1) Celiptera frustulum Guenée, Plate XXXVI, Fig. 13, ♀. Syn. discissa Walker; elongatus Grote.
The moth is found from Canada to the Gulf of Mexico east of the Rocky Mountains.

Genus ANTICARSIA Hübner

(1) Anticarsia gemmatilis Hübner, Plate XXXVII, Fig. 10, ♂.
The moth is found through the valley of the Mississippi from Wisconsin to Texas.

Genus ANTIBLEMMA Hübner

(1) Antiblemma inexacta Walker, Plate XXXVI, Fig. 23, ♂. Syn. canalis Grote.
This is a variable insect, to which a number of subspecific names have been given, based upon slight differences in the markings of the wings. It is found in the Southern States, and ranges thence to the southern portions of the South American continent.

Genus LITOPROSOPSUS Grote

(1) Litoprosopsus futilis Grote & Robinson, Plate XXXVII, Fig. 4, ♂.
The insect occurs in Florida and Georgia and also in the hotter portions of America.
Genus OPHIDERES Boisduval

This is a large genus of remarkably showy insects, which are more numerously found in the tropics of the Old World than in the New. There are several very beautiful species which are found in South America. Only one occurs sparingly as a straggler into our fauna. It is now and then taken in Florida. It is commoner in South America and is also found in Africa.

(1) Ophideres materna Linnaeus, Plate XXXVI, Fig. 8, ♀.
Syn. hybrida Fabricius; calaminea Cramer.
The insect is rare in Florida.

Genus STRENOLOMA Grote

(1) Strenoloma lunilinea Grote, Plate XXXVI, Fig. 9, ♂.
This fine moth is quite common in the valley of the Ohio, and ranges from Pennsylvania southward and westward as far as Missouri and the Gulf of Mexico.

Genus CAMPOMETRA Guenée

The species of this genus are principally found in the southern and southwestern portions of our territory.

(1) Campometra amella Guenée, Plate XXXVII, Fig. 8, ♀.
Syn. integerrima Walker; styllobata Harvey.
The species ranges from Florida to Texas.
(2) Campometra mima Harvey, Plate XXXVII, Fig. 9, ♂.
The moth occurs from Colorado to Texas and Arizona.

Genus TRAMA Harvey

Three species are assigned to this genus in recent lists.

(1) Trama detrahens Walker, Plate XXXVI, Fig. 21, ♂.
Syn. arrosa Harvey.
The habitat of this species is the Southern States.

Genus MATigramma Grote

A small genus, the species of which are southern, or southwestern, in their distribution.

(1) Matigramma pulverilinea Grote, Plate XXXVII, Fig. 11, ♀.
The moth is found from Florida to Texas.

276
EXPLANATION OF PLATE XXXVI

(The specimens figured are contained in the collection of W. J. Holland.)

1. *Andrewsia messalina* Guenée, ♂.
3. *Catocala paleogama* Guenée, ♂.
5. *Catocala neogama* Abbot & Smith, ♀.
17. *Palindia dominicata* Guenée, ♂.
22. *Graunodes smithi* Guenée, ♀.
Genus CAPNODES Guenée

The genus is well represented in the tropics of both hemispheres. There is but one species in our fauna, Capnodes punctivena Smith, a representation of which is given in the accompanying cut, drawn from the type in the National Museum.

Genus YRIAS Guenée

Not a large genus, the species of which are confined to the southwestern portions of our territory.

1) Yrias clientis Grote, Plate XXXVII, Fig. 13, ♂.
The insect is found in Arizona.

2) Yrias repentis Grote, Plate XXXVII, Fig. 12, ♂.
The moth, like its predecessor, is found in Arizona.

Genus ZALE Hübner

1) Zale horrida Hübner, Plate XXXVII, Fig. 3, ♂.
The moth is found throughout the United States east of the region of the Great Plains.

Genus SELENIS Guenée

The only species of the genus which occurs within our borders is monotropa Grote. It is found in Texas. The annexed cut was drawn from the type of the species which is preserved in the British Museum. It was made by Mr. Horace Knight, under the supervision of Sir George F. Hampson.
Noctuidae

Genus PHEOCYMA Hübner

(1) Pheocyma lucifera Hübner, Plate XXXVII, Fig. 5, ♀.
   Syn. lineola Walker.
   Found in the Appalachian subregion.

Genus YPSIA Guenée

(1) Ypsia undularis Drury, Plate XXXVII, Fig. 6, ♂.
   The moth occurs from Canada to Florida and westward to Colorado.

Genus PSEUDANTHRACIA Grote

(1) Pseudanthracia coracias Guenée, Plate XXXVII, Fig. 7, ♀.
   The insect, which is far from common in collections, has practically the same range as the preceding species, of which it appears at first glance to be a miniature reproduction.

Genus HOMOPTERA Boisduval

This is quite an extensive genus, species of which occur both in the Old World and the New. Some twenty or more so-called species are attributed to our fauna, but several of these will no doubt prove to be mere varieties or local races of others. We give figures of three of the commoner forms in our plates.

(1) Homoptera lunata Drury, Plate XXXVII, Fig. 15, ♂.
   Form edusa Drury, Plate XXXVII, Fig. 16, ♂.
   Syn. putrescens Guenée; saundersi Bethune; viridans Walker; involuta Walker.
   Almost universally distributed throughout the United States and Canada.

(2) Homoptera cingulifera Walker, Plate XXXVII, Fig. 17, ♀.
   Syn. intenta Walker; woodi Grote.
   The moth occurs from Massachusetts to Florida and westward to the region of the Great Plains.

(3) Homoptera unilineata Grote, Plate XXXVII, Fig. 14, ♀.
   The insect ranges from eastern Canada to the Carolinas and westward to the Mississippi. It appears to be quite common in eastern Massachusetts. The specimen figured on the plate was taken at Magnolia, Massachusetts.

278
Explanation of Plate XXXVII

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

9. *Campometra mima* Harvey, ♂.
11. *Matigramma pulverilinea* Grote, ♀, U. S. N. M.
12. *Yrias repentis* Grote, ♂.
15. *Homoptera lunata* Drury, ♀.
18. *Isoqona natatrix* Guenée, ♂.
20. *Xanclognatha lituralis* Hübner, ♀.
22. *Zanclognatha ochreipennis* Grote, ♂.
27. *Epizeuxis denticulalis* Harvey, ♂.
31. *Ilormisa bivittata* Grote, ♀, U. S. N. M.
32. *Bleptina caradinalis* Guenée, ♂.
33. *Capis curcata* Grote, ♀.
Genus LATEBRARIA Guenée

(1) Latebraria amphibryoides Guenée.

There is only one species of the genus known to occur within the faunal limits covered by this book. It is a straggler from the South American and Mexican territories, in which it is quite common. The accompanying cut based upon a drawing made from a specimen contained in the collection of the United States National Museum at Washington, will, no doubt, enable the student to readily recognize the species, which is not likely to be confounded with anything else.

Genus EREBUS Latreille

This is a genus of large moths most in evidence in the tropics of the New World. Only one species occurs in the United States.

(1) Erebus odora Linnaeus, Plate XXXVII, Fig. 2, ?.

Syn. agarista Cramer.

This great moth is very common in the tropical regions of America. It occurs quite abundantly in southern Florida and the warmer portions of the Gulf States, and is universally distributed over the countries of Central America and throughout tropical South America. It is found as a straggler into the northern portions of the United States, and has even been taken in Canada. I have in my collection a specimen which was taken at Leadville, Colorado, in a snowstorm which occurred there one Fourth of July. The insect, blown to that lofty and desolate spot, was caught fluttering about in the drifts.

Genus THYSANIA Dalman

(1) Thysania zenobia Cramer, Plate XXXVII, Fig. 1, ?.

This is another great South American moth, which occasionally occurs within our territory. It has been taken in Florida.
Noctuidæ
and southern Texas. It is a very abundant species in Mexico and South America.

Genus EPIZEUXIS Hübner

This is a genus of considerable size. The larvæ feed upon dried leaves for the most part. Eleven species are attributed to our fauna, five of which we figure.

(1) Epizeuxis americalis Guenee.
Syn. scriptipennis Walker.
The range of this insect is from Canada to Texas east of the Rocky Mountains. It is exceedingly common in the woods of the Appalachian subregion, and is one of the moths which are most commonly attracted to sugar. The life history has been well ascertained, and has been entertainingly described by Professor C. V. Riley in the Fourth Volume of “Insect Life.” The reader is referred to the account there given for fuller details.

(2) Epizeuxis æmula Hübner.
Syn. mollifera Walker; herminioïdes Walker; effusalis Walker; concisa Walker.
The range and the habits of this species are very much the same as those of the last mentioned species. Like it, the insect is also very frequent at sugar, and on a warm summer night, in the forests of southern Indiana, I have seen as many as twenty of these moths at one time, congregated about a spot on the trunk of a tree, which had been moistened with beer in which sugar had been dissolved.

(3) Epizeuxis lubricalis Geyer, Plate XXXVII, Fig. 29, ♂.
Syn. pharalis Guenee; surrectalis Walker.

Fig. 168.—Epizeuxis americalis. a, Larva enlarged; b, Dorsal view of larval segment; c, Lateral view of do.; d, Cremaster of pupa. (After Riley, “Insect Life,” Vol. IV, p. 111.)

Fig. 169.—Epizeuxis æmula. a, Larva enlarged; b, Segment of larva viewed laterally; c, do. viewed dorsally; d, Tip of pupa; e, Moth. (After Riley, “Insect Life,” Vol. IV, p. 110.)
The species occurs generally throughout the United States and Canada.

(4) *Epizeuxis denticulalis* Harvey, Plate XXXVII, Fig. 27, δ.
The insect is found from the Atlantic to the Mississippi and from Canada to the Carolinas.

(5) *Epizeuxis scobialis* Grote, Plate XXXVII, Fig. 28, ♀.
The moth occurs from New England to the Trans-Mississippi States, east of the Great Plains.

**Genus ZANCLOGNATHA Lederer**

The genus is of moderate size. All of the species known are found in the Appalachian subregion, and have within it a wide range.

(1) *Zanclognatha laevigata* Grote, Plate XXXVII, Fig. 21, δ.
The species is somewhat variable in the amount of dark shading upon the fore wings. It is distributed from Canada to the southern states.

(2) *Zanclognatha protumnusalis* Walker.

*Syn. minimalis* Grote.
The moth has much the same range as the last-mentioned species. Its life history has been accurately ascertained, and Professor C. V. Riley has given us an account of the habits of the insect in the paper to which reference has already been made. The types of both Walker’s and Grote’s insects are preserved in the British Museum, and there is no doubt of their identity.

(3) *Zanclognatha ochreipennis* Grote, Plate XXXVII, Fig. 22, δ.
The habitat and the habits of this species are much the same as those of the preceding.

(4) *Zanclognatha lituralis* Hübner, Plate XXXVII, Fig. 20, ♀.
The moth is widely distributed throughout the Appalachian subregion.
Noctuidæ

Genus HORMISA Walker

This is a small genus of which there are known to be four species inhabiting our territory. We figure the two commonest of these.

(1) **Hormisa absorptalis** Walker, Plate XXXVII, Fig. 19, ♂. Syn. *nubilifascia* Grote. The moth ranges from Canada to Virginia and westward to Illinois.

(2) **Hormisa bivittata** Grote, Plate XXXVII, Fig. 31, ♂. The moth, which is not common in collections, is found from Quebec and Maine to Wisconsin and Iowa, and southward as far as Pennsylvania and Ohio.

Genus SISYRHYPENA Grote

![Sisyrhypena orchestralis](image)

Fig. 171.—*Sisyrhypena orchestralis*, ♂. ♀.

(1) **Sisyrhypena orchestralis** Walker. Syn. *pupillaris* Grote; *harti* French. The figure which we give was drawn for this book from the type of the species which is in the collection of Mr. Grote in the British Museum. The insect occurs in the southern States.

Genus PHILOMETRA Grote

Three species are reckoned as belonging to this genus. We give a figure of one of them.

(1) **Philometra metonalis** Walker, Plate XXVII, Fig. 30, ♂. Syn. *goasalis* Walker; *longilabris* Grote. The moth is found from Nova Scotia and the region of Hudson Bay to Virginia and westward to Illinois.

Genus CHYTOLITA Grote

(1) **Chytolita morbidalis** Guenée, Plate XXXVII, Fig. 23, ♀. The moth is not at all uncommon in the Atlantic subregion.
Genus HYPENULA Grote

One species is reckoned as belonging to this genus.

Fig. 172.—Hypenula cacuminalis, ♂. ¼.

(1) Hypenula cacuminalis Walker.
Syn. biferalis Walker; opacalis Grote.

The moth is a native of the southern portions of our territory.

The figure we give is taken from Walker's type, which is preserved in the British Museum. We also give a figure of a specimen preserved in the American Museum of Natural History, and which was determined by Mr. Grote as his species, to which he gave the name opacalis. The comparison of the two figures will serve to illustrate the variability of the species.

Genus RENIA Guenée

There are eight species belonging to the genus which are found within the region covered by this book. One of the commonest of these is selected for illustration.

(1) Renia discoloralis Guenée, Plate XXXVII, Fig. 24, ♂.
Syn. fallacialis Walker; generalis Walker; thraxalis Walker.

The insect is very common in the Appalachian subregion.

Genus BLEPTINA Guenée

(1) Bleptina caradrinalis Guenée, Plate XXXVII, Fig. 32, ♂.
Syn. cloniasalis Walker.

The moth occurs from Canada to the Gulf of Mexico, and westward to the Rocky Mountains.

Genus TETANOLITA Grote

Three species are assigned to this genus in the latest lists. Of these, we have selected the one which is the type of the genus
Noctuidæ

for purposes of illustration. The specific name mynesalis was originally applied to the insect by Walker. Subsequently Grote gave it the name lixalis. The cut hereto annexed was drawn

![Image of Tetanolita mynesalis](image)

from Walker's type, which is contained in the collections of the British Museum. The moth ranges from Pennsylvania to Illinois and southward to the Gulf of Mexico.

Genus HETEROGRAMMA Guenée

(1) Heterogramma pyramusalis Walker, Plate XXXVII, Fig. 26, ♂.

Syn. gyasalis Walker; rurigena Grote.

The species is found from Canada to the Gulf of Mexico and westward to the region of the Great Plains. It is the only species in the genus.

Genus GABERASA Walker

(1) Gaberasa ambigualis Walker, Plate XLII, Fig. 2, ♂.

Syn. bifidalis Grote; indivisalis Grote.

The male moth has the fore wings bifid. Grote described the female, which has not bifid wings, under the name indivisalis. The moth occurs from Canada to Texas.

Genus DIRCETIS Grote

![Image of Dircetis pygmea](image)

Fig. 175.—Dircetis pygmea Grote, ♀. ♩.

There are two species of the genus which are found within our borders. We give in the cut a figure of the type of Grote's
species to which he applied the name *pygmaea*. It is found from Florida to Texas along the shores of the Gulf of Mexico.

**Genus PALTHIS Hübner**

Two species of the genus are found within the United States. We figure both of them.

(1) *Palthis angulalis* Hübner, Plate XXXVII, Fig. 25, ♀.

Syn. *aracinthusalis* Walker.

The insect is very common everywhere from Canada to the Gulf of Mexico east of the Great Plains.

(2) *Palthis asopialis* Guenée, Plate XLII, Fig. 1, ♀.

The distribution of the species is the same as that of the preceding.

**Genus CAPIS Grote**

(1) *Capis curvata* Grote, Plate XXXVII, Fig. 33, ♀.

The insect is found in Maine, northern New York, and Canada. It is the only species belonging to the genus.

**Genus SALIA Hübner**

Two species belonging to the genus are found within our territory. We figure in the accompanying cut the type of one of these, which received the specific name *interpuncta* at the hands of Mr. Grote.

![Image of Salia interpuncta](image)

**Fig. 176.**—*Salia interpuncta*, ♀. ♀

The moth is found from Massachusetts to Arizona.

**Genus LOMANALTES Grote**

(1) *Lomanaltes eductalis* Walker.

Syn. *letulus* Grote.

The figure of the moth which we give was drawn for this book by Mrs. Beutenmüller of New York from a specimen contained in the collections of the American Museum of Natural History. The insect ranges from Nova Scotia to Minnesota and southward to New York and Pennsylvania.

![Image of Lomanaltes eductalis](image)

**Fig. 177.**—*Lomanaltes eductalis*, ♂. ♀

285
Noctuidae

Genus BOMOLOCHA Hübner

Sixteen species occurring within our limits are attributed to this genus in the latest List of the Lepidoptera of North America. Nine of these we illustrate.

1. **Bomolocha manalis** Walker, Plate XLII, Fig. 3, ♂.
The moth ranges from Canada and Minnesota southward to the valleys of the Potomac and the Ohio.

2. **Bomolocha baltimoralis** Guenée, Plate XLII, Fig. 4, ♀.
   Syn. *benignalis* Walker; *laciniosa* Zeller.
The geographical distribution of the species practically coincides with that of the last.

3. **Bomolocha bijugalis** Walker, Plate XLII, Fig. 7, ♀.
   Syn. *fecialis* Grote; *pallialis* Zeller.
The insect occurs from Canada to Florida and westward to the Rocky Mountains.

4. **Bomolocha scutellaris** Grote, Plate XLII, Fig. 10, ♂.
The moth is found from New England to British Columbia, but does not range far to the south.

5. **Bomolocha abalinealis** Walker, Plate XLII, Fig. 5, ♂.
The habitat of the insect extends from New England and Canada westward to Illinois and southward to Pennsylvania and the Virginias.

6. **Bomolocha madefactalis** Guenée, Plate XLII, Fig. 6, ♂.
   Syn. *achatinalis* Zeller; *damnosalis* Walker; *caducalis* Walker; *projecta* Grote.
The insect is found from the Middle States southward to Texas.

7. **Bomolocha toreuta** Grote, Plate XLII, Fig. 9, ♂.
The moth ranges over the same region as the last-mentioned species.

8. **Bomolocha deceptalis** Walker, Plate XLII, Fig. 8, ♂.
   Syn. *perangulalis* Harvey.
The moth is found from Canada to Virginia.

9. **Bomolocha edictalis** Walker, Plate XLII, Fig. 11, ♂.
   Syn. *lentiginosa* Grote; *vellijera* Grote.
The range of the species is the same as that of the last mentioned.
Genus PLATHYPENA Grote

Only one species of the genus is known to occur within our territory.

(1) Plathypena scabra Fabricius, Plate XLII, Fig. 14, ♂.

Syn. erectalis Guenée; palpalis Haworth; crassalis Haworth; obesalis Stephens.

Universally distributed through the United States and Canada east of the Rocky Mountains.

Genus HYPENA Schrank

The genus is found in all parts of the globe. Three species are known to be found in our territory. Of these we figure the one which is commonest.

(1) Hypena humuli Harris, Plate XLII, Fig. 12, ♂; Fig. 13, ♀, var.

Syn. evanidalis Robinson; germanalis Walker.

This insect, the larva of which does considerable damage to the hop, is widely distributed over the whole of the United States and Canada. It is somewhat variable in the shade of the wings and the amount of maculation upon them. For an account of the habits of the insect and the best manner to guard against the ravages which the larva commits the reader is referred to the excellent article by Dr. L. O. Howard of the Department of Agriculture in Washington upon insects injurious to the hop-vine, which was published as the Seventh Bulletin of the New Series of Bulletins issued by the Division of Entomology of the Department.

Arm. Who was Samson's love, my dear Moth?

Moth. A woman, master.

—Shakespeare, Love's Labor's Lost, I, 2.
FAMILY NYCTEOLIDÆ

"An vnredy reue thi residue shal spene,
That menye moththe was maister ynne, in a mynte-while."
PIERS PLOWMAN (C) xiii, 216.

The Nycteolidæ are related to the Noctuidæ, many of the genera, especially in the Old World, containing moths which are green in color and frequent trees. The apex of the fore wing is more or less produced to a point. The larvæ have eight pairs of legs, and are fleshy, with the anal somite tapering to a point. They are either naked or slightly pubescent. But two genera are found in the United States.

Genus NYCTEOLA Hübner

The genus is represented in both the Old World and the New. Two species are found in the United States.

(1) Nycteola revayana Scopoli, form lintnerana Speyer, Plate XLII, Fig. 15, ♂.

A large number of synonyms and subspecific forms have been erected by authors who have dealt with this species. The form which we figure is the one which is most commonly encountered in our territory.

Genus HYBLÆA Fabricius

This genus is extensively developed in the warmer portions of the Eastern Hemisphere, but is represented by only one species in our region.

(1) Hyblæa puera Cramer, Plate XXX, Fig. 8, ♀.

Syn. saga Fabricius; mirificum Streckert.

The insect, which is common in the tropics of the two hemispheres, occurs occasionally in Florida. The specimen figured on our plate is contained in the collection of the United States National Museum.
FAMILY PERICOPIDÆ
(HYSIDÆ AUCTORUM)

"Loose to the wind their airy garments flew,
Thin glittering textures of the filmy dew,
Dipt in the richest tincture of the skies,
Where light disports in ever-mingling dyes,
While every beam new transient colours flings,
Colours that change whene'er they wave their wings."

Pope.—Rape of the Lock.

The following characterization of the family is taken from Hampson’s "Moths of India," Vol. I, p. 495: "Proboscis present. Palpi smoothly scaled; the third joint long and naked. Legs smooth; mid tibiae with one pair of spurs, hind tibiae with two pairs. Frenulum present. Fore wing with vein 1a separate from 1b; 1c absent; 5 from near lower angle of cell. Hind wing with veins 1a and 1b present, 1c absent; 5 from near lower angle of cell; 8 free from the base and connected by a bar with 7 at middle of cell.

"Larva with all the legs present, sparsely covered with long hairs.

"Cocoon slight."

Genus DARITIS Walker

A small genus of rather showy moths, which is represented in our fauna by two species.

(1) Daritis thetis Klug, Plate XXXVIII, Fig. 5, ♀.
The insect occurs in southern Arizona.

Genus COMPOSIA Hübner

(1) Composia fidelissima Herrich-Schaeffer, Plate XXXVIII, Fig. 4, ♂.
Syn. olympia Butler.

289
This very beautiful moth is found throughout the Antilles and in southern Florida. It is the only representative of its genus which occurs within our territory.

**Genus GNOPHÆLA Walker**

Three species of this genus are found within the limits of the United States. Others occur in Mexico and Central America.

(1) *Gnophæla latipennis* Boisduval, Plate XXXVIII, Fig. 2, ♂

Syn. *hopfferi* Grote & Robinson; *discreta* Stretch; *arisonæ* French; *morrisoni* Druce.

The habitat of this species is the southwestern portion of our territory and northern Mexico.

(2) *Gnophæla vermiculata* Grote & Robinson, Plate XXXVIII, Fig. 3, ♂

The moth is found from southern Colorado westward and south-westward.

(3) *Gnophæla clappiana* Holland, Plate XXXVIII, Fig. 1, ♂

The figure on our plate represents the type of the species, which was taken at Colorado Springs. It occurs from central Colorado to Arizona.

**DAS LIED VOM SCHMETTERLINGE**

"Liebes, leichtes, luft'ges Ding, Schmetterling, Das da über Blumen schwebet, Nur von Thau und Blüten lebet, Blüte selbst, ein fliegend Blatt, Das, mit welchem Rosenfinger! Wer bepurpur't hat?

Fleuch dahin, O Seelchen, sei Froh und frei, Mir ein Bild, was ich sein werde, Wenn die Raupe dieser Erde Auch wie du ein Zephyr ist Und in Duft und Thau und Honig Jede Blüte küssst."

**H**ERDER.
Explanation of Plate XXXVIII

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Gnaphela clappiana Holland, ♂, type.
2. Gnaphela latipennis Boisduval, ♂.
4. Composia fidelissima Herrich-Schaeffer, ♂.
5. Daritis thetis Klug, ♀.
6. Phryganidia californica Packard, ♂.
7. Olene leucophaea Abbot & Smith, ♂.
8. Olene leucophaea Abbot & Smith, ♀.
13. Porthetria dispar Linnaeus, ♀.
15. Psilura monacha Linnaeus, ♀.
17. Hemerocampa definita Packard, ♂, U. S. N. M.
18. Notolophus antiqua Linnaeus, ♂, U. S. N. M.
19. Hemerocampa vetusta Boisduval, ♂, U. S. N. M.
20. Hemerocampa leucostigma Abbot & Smith, ♂.
22. Carama cretata Grote, ♂, U. S. N. M.
23. Lagoa crispata Packard, ♂.
24. Lagoa pyxidifera Abbot & Smith, ♂.
25. Megalopyge opercularis Abbot & Smith, ♂.
FAMILY DIOPTIDÆ

"Genius detects through the fly, through the caterpillar, through the grub, through the egg, the constant individual; through countless individuals the fixed species, through many species the genus, through all genera the steadfast type; through all the kingdoms of organized life the eternal unity." —Ralph Waldo Emerson.

The moths belonging to this family are, so far as is known, closely related in many respects to the Geometridæ. They differ, however, in having veins 3 and 4 of the hind wing arising from a common stalk at the lower angle of the cell. The family is well represented in the tropics of the New World, but is only known in our territory by the genus Phryganidia Packard, which occurs in southern California.

Genus PHRYGANIDIA Packard

(1) Phryganidia californica Packard, Plate XXXVIII, Fig. 6, ♂.

The moth, which is obscurely colored, is one of the least attractive insects belonging to the family which it represents. Many of the species are very bright and gay in color, as any student of the fauna of South America knows. The home of the species, as the name implies, is California, to the southern portion of which it is confined.

"Happy insect, what can be
In happiness compared to thee?
Fed with nourishment divine,
The dewey morning's gentle wine!
Nature waits upon thee still,
And thy verdant cup does fill;
'Tis filled wherever thou dost tread
Nature's self thy Ganymede.

"Thou dost drink and dance and sing,
Happier than the happiest king!
All the fields which thou dost see,
All the plants belong to thee,
All the summer hours produce,
Fertile made with early juice,
Man for thee does sow and plough,
Farmer he, and landlord thou."

From the Greek of Anacreon.

291
FAMILY NOTODONTIDÆ

"The Beauty which old Greece or Rome
Sung, painted, wrought, lies here at home;
We need but eye and ear
In all our daily walks to trace
The outlines of incarnate grace,
The hymns of gods to hear."

Whittier.

The Notodontidae have been characterized by Sir George F. Hampson as follows: "A family of moths superficially resembling the Noctuidæ. Mid tibia with one pair of spurs; hind tibia with two pairs; tarsi short and hairy. Fore wing with vein 1a forming a fork with 1b at the base; 1c absent; vein 5 from the middle of the discocellulars, or rarely from just below the upper angle of the cell. Hind wings with two internal veins; vein 5 from the centre of the discocellulars or rarely absent; 8 free from the base, curved, and running close along the subcostal nervure or joined to it by a bar.

"Larva" without the anal prolegs, and carrying the anal somites more or less erect; these often bear paired processes and are sometimes swollen; the other somites are often prominently humped.

"Pupa naked."

An elaborate and very useful monograph dealing with the insects composing this family has been written by Professor A. S. Packard, and is published in the Memoirs of the National Academy of Science, Vol. VII, pp. 87-284. The student will do well to refer to this.

Genus APATELODES Packard

(1) Apatelodes torrefacta Abbot & Smith, Plate XL, Fig. 20, 3.

The insect is not uncommon in the Appalachian subregion. It ranges from Canada to the southern States and as far west as the Mississippi.

292
(2) **Apatelodes angelica** Grote, Plate XL, Fig. 21, ♂.

Syn. *hyalinopuncta* Packard.

The distribution of this species is the same as that of the preceding. It is rather common in western Pennsylvania.

**Genus MELALOPHA** Hübner

Six species and a number of subspecies have been recognized as belonging to this genus and are found in the region with which this book deals. Of four of these we give figures.

(1) **Melalopha apicalis** Walker, Plate XL, Fig. 18, ♂.

Syn. *vau* Fitch; *indentata* Packard.

The figure upon our plate, cited above, represents the form of the species to which Grote & Robinson applied the name *ornata* and of which the name *incarcerata* Boisduval is a synonym. The insect is widely distributed all over the United States.

(2) **Melalopha inclusa** Hübner, Plate XL, Fig. 19, ♀.

Syn. *americana* Harris.

The insect is very widely distributed over the Appalachian subregion. The larva feeds upon the leaves of various species of the genus *Populus*.

(3) **Melalopha strigosa** Grote, Plate XL, Fig. 17, ♂.

The habitat of this species is the northern portion of the Appalachian subregion.

(4) **Melalopha albosigma** Fitch, Plate XL, Fig. 16, ♂.

Widely distributed over the United States. Easily discriminated from the other species by the broad brown shade on the apical half of the outer margin of the primaries, succeeded near the costa by a distinct s-shaped white line.

**Genus DATANA** Walker

Thirteen species which are properly referred to this genus are found within our limits. Of these we give figures of the four which are most commonly found.

(1) **Datana ministra** Drury, Plate I, Fig. 13, larva; Plate XL, Fig. 11, ♂.

This is a very common species, found throughout the Appalachian subregion. The larvae are gregarious and may be found in great masses upon the leaves of the walnut and allied trees in the latter part of August and early September.

(2) **Datana angusi** Grote & Robinson, Plate XL, Fig. 12, ♂.
Notodontidae

The habits and the distribution of this species are very much the same as those of the preceding.

(3) Datana perspicua Grote & Robinson, Plate XL, Fig. 14, ♂.

More nearly allied to D. ministra than to any other species of the genus, but readily distinguished from that insect by the paler color of the secondaries and the lighter, more yellowish color of the primaries.

(4) Datana integerrima Grote & Robinson, Plate XL, Fig. 13, ♂.

The darker color of the primaries and the more numerous transverse bands enable this species to be at once separated from the other species which we have figured.

Genus HYPERÆSCHRÀ Butler

(1) Hyperæschra stragula Grote, Plate XL, Fig. 1, ♂.
Syn. scitipennis Walker.
The moth is found throughout the United States. With the help of the illustration we have given there should be no difficulty whatever in determining it.

(2) Hyperæschra georgica Herrich-Schæffer, Plate XL, Fig. 7, ♂.
The moth is found in the Appalachian subregion, and is commoner in the southern portions of its range than in the more northern portions thereof. It is, however, not very rare in Pennsylvania.

(3) Hyperæschra tortuosa Tepper, Plate XL, Fig. 4, ♀.
The insect is as yet quite rare in collections. Its habitat is Colorado and Arizona.

Genus ODONTOSIA Hübner

(1) Odontosia elegans Strecker, Plate XL, Fig. 3, ♂.
This elegant insect is found from Canada to Colorado and appears to be commoner in the region of the Rocky Mountains than elsewhere.

Genus NOTODONTA Ochsenheimer

The genus is represented in both hemispheres. There are two species which belong to our fauna. We give illustrations of both of them.
Notodontidae

(1) Notodonta basitriens Walker, Plate XL, Fig. 5, ♂.
The moth is found in the Atlantic States.

(2) Notodonta simplaria Græf, Plate XL, Fig. 6, ♀.
The moth, which is by no means common, occurs in the northern portions of the Appalachian subregion.

Genus PHEOSIA Hübner

(1) Pheosia dimidiata Herrich-Schaeffer, Plate XL, Fig. 9, ♂.
Syn. rimosa Packard; californica Stretch.
The moth, which is far from common, ranges from Canada and New England westward to the region of the Rocky Mountains.

(2) Pheosia portlandia Henry Edwards, Plate XL, Fig. 10, ♂.
Syn. descherei Neumægen.
The species replaces in the northwestern States the form, which has been described as dimidiata. Whether this is a valid species or a local race of the preceding is a question which is still open to discussion.

Genus LOPHODONTA Packard

(1) Lophodonta ferruginea Packard, Plate XL, Fig. 8, ♀.
The moth is not rare in the Appalachian subregion. The caterpillar feeds upon the linden (Tilia).

(2) Lophodonta angulosa Abbot & Smith, Plate XL, Fig. 15, ♂.
The insect is found in the same region as the last mentioned, and its habits are very much the same.

Genus EUNYSTALEA Grote

(1) Eunystalea indiana Grote.
This is one of the rarest insects of the family to which it belongs. Besides the type, which the writer believes to be contained in the collection of the British Museum, there is only one other specimen known, which is found in the collection of Dr. Barnes, to whom the author is indebted for the privilege of being allowed to make the cut which is given herewith. The insect occurs in Florida.

Fig. 179.—Eunystalea indiana ♂. ♀.
Notodontidae

Genus NADATA Walker

(1) Nadata gibbosa Abbot & Smith, Plate XXXIX, Fig. 1, ♀.
This insect, the distribution of which is almost universal throughout our territory, has been described under a number of varietal or subspecific names, founded for the most part upon trifling variations in the ground-color of the wings.

Genus NERICE Walker

(1) Nerice bidentata Walker, Plate I, Fig. 15, larva; Plate XXXIX, Fig. 2, ♂.
The larva feeds upon the elm. The insect has a wide range through the Appalachian subregion.

Genus SYMMERISTA Hübner

(1) Symmerista albifrons Abbot & Smith, Plate XXXIX, Fig. 7, ♀.
A very common insect in the Appalachian subregion, ranging from the Atlantic westward as far as the region of the Rocky Mountains.

Genus HIPPIA Mæschler

(1) Hippia packardi Morrison, Plate XXXIX, Fig. 18, ♀.
A rather scarce insect in collections. Its habitat is Texas.

Genus DASYLOPHIA Packard

(1) Dasylophia anguina Abbot & Smith, Plate XXXIX, Fig. 5, ♂.
Syn. cuculifera Herrich-Schæffer; punctata Walker; cana Walker; signata Walker.
The moth ranges from the Atlantic to the Rocky Mountains.
(2) Dasylophia thyatiroides Walker, Plate XXXIX, Fig. 6, ♀.
Syn. interna Packard; tripartita Walker.
The habitat of the moth is the Appalachian subregion. The specimen figured was taken in Indiana.

Genus LITODONTA Harvey

(1) Litodonta hydromeli Harvey, Plate XXXIX, Fig. 20, ♂.
The moth, which is the sole representative of the genus in

Explanation of Plate XXXIX

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Nadata gibbosa Abbot & Smith, ♀.
3. Hyparpax venus Neumægen, ♂, U. S. N. M.
4. Hyparpax aurora Abbot & Smith, ♂, U. S. N. M.
5. Dasylophia anguina Abbot & Smith, ♂.
7. Simmerista albifrons Abbot & Smith, ♀.
8. Harpyia cinerea Walker, ♀, U. S. N. M.
10. Harpyia albicoma Strecker, ♂, U. S. N. M.
11. Harpyia scolopendrina Boisduval, ♂.
12. Cerura multiscripta Riley, ♂.
14. Schizura badia Packard; ♀, U. S. N. M.
15. Schizura concinna Abbot & Smith, ♂.
17. Schizura unicornis Abbot & Smith, ♂.
19. Ianassa lignicolor Walker, ♀, U. S. N. M.
20. Litodonta hydromeli Harvey, ♂.
24. Heterocampa bilineata Packard, ♂.
25. Heterocampa biundata Walker, ♂.
27. Gluphisia severa Henry Edwards, ♂, U. S. N. M.
30. Fentonia marthesia Cramer, ♂.
our fauna, is not at all uncommon in Texas and Arizona, and ranges southward into northern Mexico.

Genus HETEROCAMPA Doubleday

Eleven species belonging to this somewhat extensive genus are recognized as occurring within the limits with which this book deals. Six of these have been selected for illustration.

1. Heterocampa astarte Doubleday, Plate XXXIX, Fig. 22, ɸ.
   Syn. varia Walker; menas Harris.
   The moth is not uncommon in the southern States and ranges northward as far as Pennsylvania and Ohio.

2. Heterocampa obliqua Packard, Plate XL, Fig. 2, ɸ.
   The insect occurs in the northern portions of the Appalachian subregion.

3. Heterocampa umbrata Walker, Plate XXXIX, Fig. 26, ɸ.
   Syn. semiplaga Walker; pulveca Grote & Robinson; athereo Harris.
   The moth is rather common in the Appalachian subregion, ranging from the Atlantic as far west as the Mississippi.

4. Heterocampa manteo Doubleday, Plate XXXIX, Fig. 23, ɸ.
   Syn. cinerascens Walker; subalbicans Grote.
   The distribution of this species is the same as that of the last mentioned.

5. Heterocampa biundata Walker, Plate XXXIX, Fig. 25, ɸ.
   Syn. olivatus Packard; mollis Walker.
   Like the preceding species, this is a native of the eastern portion of our territory, and occurs from Canada southward to Georgia.

6. Heterocampa bilineata Packard, Plate XXXIX, Fig. 24, ɸ.
   Syn. turbida Walker; associata Walker; ulmi Harris.
   Not uncommon in the eastern States.

Genus MISOGADA Walker

1. Misogada unicolor Packard, Plate XXXIX, Fig. 21, ♂.
   Syn. marina Packard; cinerea Schaus (non Packard); sobria Walker.
   This is the sole species of the genus. It inhabits the Appalachian subregion.
Genus EUHYPARPAKX Beutenmüller

The only species of the genus as yet known is that to which Beutenmüller applied the name rosea. It is a native of Colorado, and is as yet very rare in collections, only one specimen, the type, being known. This is found in the collection of the American Museum of Natural History in New York. The moth is pale rosy red in color, and marked as shown in the cut, which was drawn from the type by Mrs. Beutenmüller.

Genus IANASSA Walker

(1) Ianassa lignicolor Walker, Plate XXXIX, Fig. 19,♀.
Syn. virgata Packard; lignigera Walker.
The habitat of the species is the Appalachian subregion. Two other species, both of them inhabiting the southwestern portions of our territory, are known to belong to the genus.

Genus SCHIZURA Doubleday

(1) Schizura ipomoeae Doubleday, form cinereofrons Packard, Plate XXXIX, Fig. 13,♂.
The species is widely distributed throughout the United States. Several subspecific or varietal forms have been described, and a number of synonyms have been created for the species. For a knowledge of these the reader may refer to the Monograph by Professor Packard, to which allusion has already been made.

(2) Schizura concinna Abbot & Smith, Plate XXXIX, Fig. 15, ♂.
Syn. nitida Packard.
This is also a widely distributed species. The larva feeds upon the Rosaceae.

(3) Schizura unicornis Abbot & Smith, Plate XXXIX, Fig. 17,♂.
Syn. edmansi Packard; humilis Walker; conspecta Henry Edwards.
This is a very common species of wide distribution. Its habits are much the same as those of the last mentioned.

298
Notodontidae

(4) Schizura badia Packard, Plate XXXIX, Fig. 14, ♀.  
Syn. significata Walker.  
The habitat of the species is the Appalachian subregion.

(5) Schizura leptinoides Grote, Plate XXXIX, Fig. 16, ♂.  
Syn. mustelina Packard.  
The insect ranges through the Atlantic States westward to the Mississippi.

Genus HYPARPAX Hübner

(1) Hyparpax aurora Abbot & Smith, Plate XXXIX, Fig. 4, ♂.  
Syn. rosea Walker; venusta Walker.  
The moth occurs in the Appalachian subregion, but is more common in Virginia than elsewhere, so far as the observations of the writer extend.

(2) Hyparpax venus Neumügen, Plate XXXIX, Fig. 3, ♂.  
The habitat of the insect is Colorado.

(3) Hyparpax perophoroides Strecker, Plate XL, Fig. 28, ♂.  
The insect has thus far been reported only from Florida. I am indebted to Mr. Beutenmüller for the loan of the specimen, which is figured upon the plate.

Genus CERURA Schrank

The genus is found in both hemispheres. Two species are attributed to it as being found in the United States.

(1) Cerura scitiscripta Walker, form multiscripta Riley, Plate I, Fig. 18, larva; Plate XXXIX, Fig. 12, ♂.  
The moth is known to occur from New England to Mexico.

Genus HARPYIA Ochsenheimer

(1) Harpyia borealis Boisduval, Plate XXXIX, Fig. 9, ♂.  
The range of the species is through the Appalachian subregion.

(2) Harpyia cinerea Walker, Plate XXXIX, Fig. 8, ♀.  
The moth occurs almost everywhere throughout the United States and southern Canada.

(3) Harpyia scolopendrina Boisduval, Plate XXXIX, Fig. 11, ♂.  
Syn. aquilonaris Lintner.  
Form albicoma Strecker, Plate XXXIX, Fig. 10, ♂.
Notodontidae

The insect is a denizen of Canada and the northern portions of the United States from the Atlantic to the Pacific.

Genus FENTONIA Butler

(1) Fentonia marthesia Cramer, Plate XXXIX, Fig. 30, ♂.
   Syn. tessella Packard; turbida Walker.
   The moth, which is by no means common, has a wide range through the Appalachian subregion.

Genus GLUPHISIA Boisduval

(1) Gluphisia septentrionalis Walker, Plate XXXIX, Fig. 28, ♂.
   Syn. clandestina Walker; trilineata Packard.
   Widely distributed throughout the entire territory.
(2) Gluphisia wrighti Henry Edwards, Plate XXIX, Fig. 29, ♂.
   The moth is found in southern California and Arizona, as well as in northern Mexico.
(3) Gluphisia severa Henry Edwards, Plate XXXIX, Fig. 27, ♂.
   Syn. danbyi Neumoegen; avimacula Hudson; slossoni Packard.
   The species, which is somewhat variable in the maculation of the wings, is found in the northern portions of our territory.

Genus ELLIDA Grote

(1) Ellida caniplaga Walker, Plate XXXIX, Fig. 31, ♀.
   Syn. transversata Walker; gelida Grote.
   The moth in Pennsylvania is double-brooded. The first brood appears upon the wing in the early spring. The caterpillar feeds upon the linden (Tilia). The second brood is matured about the end of July. The insect is not common in collections, because its habits have not been hitherto understood.

Genus CARGIDA Schaus

(1) Cargida cadmia Guenée.
   Syn. obliquilinea Walker.
   The moth is a native of the southern States, and ranges from Texas southward to Costa Rica. The cut which we give is
EXPLANATION OF PLATE XL

(When not otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

3. Odontosia elegans Strecker, ♂.
4. Hyperaeschrā tortosā Tepper, ♀, U. S. N. M.
5. Notodontā basitriens Walker, ♀, U. S. N. M.
6. Notodontā simplaria Græf, ♀, U. S. N. M.
8. Lophodonta ferruginēa Packard, ♀.
10. Pheosia portlandiā Henry Edwards, ♂, U. S. N. M.
11. Datana ministra Drury, ♂.
15. Lophodonta angulosā Abbot & Smith, ♂.
17. Melalophā sirigosa Grote, ♀, U. S. N. M.
18. Melalophā apicalis Walker, var. ornata Grote & Robinson, ♀, U. S. N. M.
19. Melalophā inclusa Hübner, ♀.
20. Apatelodes torrejacta Abbot & Smith, ♂.
22. Habrosyne scripta Gosse, ♂.
23. Euthyatira pudens Guenée, ♂, Merrick Collection.
24. Euthyatira pudens var. pennsylvania Smith, ♀, Merrick Collection.
25. Pseudothyatira cymatophoroides Guenée, ♂.
27. Bombycia tearlī Henry Edwards, ♂, U. S. N. M.
drawn from the type of Walker's species, which is contained in the British Museum. The insect is rare as yet in collections, though specimens coming from Central America are far more numerous in cabinets than specimens obtained from points within the limits of the United States.

(2) Cargida pyrrha Druce, Plate XI, Fig. 15, ♀.
The insect occurs in southern Arizona and in Mexico.

Genus CRINODES Herrich-Schaeffer

(1) Crinodes beskei Hübner, Plate XLI, Fig. 4, ♂.
This very peculiar moth is the only representative of its genus which occurs within our territory. There are numerous species found in the tropics of the New World. The habitat of the present species is Arizona and Mexico.

NASU-NO TAKE

Nasu-no Take is a volcano in the interior of Japan. Tora-san came into my room on the upper floor of the tea-house where we had made our stay while exploring the summit of the mountain, which was in eruption at the time. Tora-san was my fidus Achates. He could make an insect-box or repair a jinrickisha, for he was "an honorable carpenter." He did not disdain, when necessity demanded, to prove himself a capable cook, though this was not his calling. He could provide a meal of "America-no Chow" or "Nippon-no Chow," the cuisine of Anglo-Saxon and of Japanese being alike familiar to him. He was best of all an enthusiastic entomologist, and much preferred sugaring for moths to making curries. "Danna-san," he said, "Nasu-no Take have got many moth Tokio no have got." "Yea, verily! good Tora-san." "Danna-san, me catchee moth
ko komban sugar way. Danna-san go long?” “With all my heart! Sayo!” And so it was arranged.

In the oak-forest below the tea-house we sugared the trees. When the night came on we went with our lanterns to the spot. The black shadows clung to the woodland path. As the lanterns went bobbing along the narrow way, each turn produced a weird and beautiful effect. The gnarled old pines, the oaks and the bamboos, the wild yams festooning the shrubbery, thrust forth for a moment into relief against the universal darkness, were fascinating to look upon. Here and there white lilies held up their stately blossoms, and starry flowers, from which the moths fled as we came along, bloomed everywhere. The effect of moving lights in shrubbery and forest-growths is always charming.

But the captures of that night were more memorable than all the witchery of the strange and beautiful scenery in the midst of which we walked. The gems of our catch were a dozen perfect specimens of the great Snowy Underwing, the most beautiful as well as one of the rarest species of the splendid genus to which it belongs. I never pull out the drawer in the cabinet, where these things have rested full many a day since then, without seeing visions and dreaming dreams of the happy past. How much "globe-trotters" miss when they are not students of nature! The memory of one such night spent in the wild woods is worth the memory of weeks spent in palaces.

"The insect legions, prank’d with gaudiest hues,
Pearl, gold and purple, swarm’d into existence.
Minute and marvellous creations these.

some proudly shone
Like living jewels; some grotesque, uncouth,
And hideous
Those lived deliciously on honey-dews,
And dwelt in palaces of blossomed bells.
Millions on millions, wing’d and plumed in front,
Fill’d the dim atmosphere with hum and hurry.

MONTGOMERY. — Pelican Island.
FAMILY THYATIRIDÆ

"Feeble though the insect be,
Allah speaks through that to thee!
As within the moonbeam I,
God in glory sits on high,
Sits where countless planets roll,
And from thence controls the whole:
There with threads of thousand dyes
Life's bewildered web he plies,
And the hand which holds them all
Let's not e'en the feeblest fall."

CÉHLENSCHLEGER.—Aladdin’s Lamp.

The family has been characterized as follows by Sir George F. Hampson, in his work upon the moths of India:

"A family of moths resembling the Noctuidæ in appearance.
Proboscis present. Antennæ usually rather thickened and flattened. Mid tibia with one pair of spurs, hind tibia with two pairs. Fore wing with vein 1a short and slight, not forming a fork with 1b; 1c absent; 5 from the center of the discocellulars; veins 7 and 8 stalked; and 9 and 10 stalked, and almost or quite anastomosing with veins 7 and 8 to form an areole. Hind wing with two internal veins; vein 5 from the center of the discocellulars, or generally from below the center; veins 6 and 7 given off not far from the base; 8 bent down and quite or almost touching 7 after the bifurcation.
Larva noctuiform, with five pairs of prolegs."

Genus HABROSYNE Hübner

(1) Habrosyne scripta Gosse, Plate XL, Fig. 22, 5.

The moth is quite common locally in the northern States of the Atlantic seaboard, and ranges westward to the central portions of the Valley of the Mississippi.
Genus **PSEUDOThyATIRA** Grote

(1) *Pseudothyatira cymatophoroides* Guenee, Plate XL, Fig. 25, ♂.
   Form *expultrix* Grote, Plate XL, Fig. 26, ♂.
   The moth, which occurs in the two forms which we have delineated on the plate, is a native of the northern portions of the Appalachian subregion. It is common in Pennsylvania.

Genus **EUTHYATIRA** Smith

(1) *Euthyatira pudens* Guenee, Plate XL, Fig. 23, ♂.
   Form *pennsylvanica* Smith, Plate XL, Fig. 24, ♀.
   The moth emerges in the very early spring, and may be found where it is common, seated about three inches from the end of twigs in the woodlands, with its wings folded about the twig in such a way as to elude the observation of those who are not familiar with its habits. The form *pennsylvanica* is found in both sexes in every brood. It represents a curious case of dimorphism.

Genus **BOMBYCIA** Hübner

(1) *Bombycia improvisa* Henry Edwards, Plate XL, Fig. 27, ♂.
   The habitat of the insect is on the Pacific slope, in the northern portions of the coast ranges.

"Then rapidly with foot as light
As the young musk-roe's, out she flew
To cull each shining leaf that grew
Beneath the moonlight's hallowing beams
For this enchanted wreath of dreams,
Anemones and Seas of Gold,
   And new-blown lilies of the river,
And those sweet flowrets that unfold
Their buds on Camadeva's quiver."

*Thomas Moore.*—*Lalla Rookh.*
FAMILY LIPARIDÆ

"The study of entomology is one of the most fascinating of pursuits. It takes its votaries into the treasure-houses of Nature, and explains some of the wonderful series of links which form the great chain of creation. It lays open before us another world, of which we have been hitherto unconscious, and shows us that the tiniest insect, so small perhaps that the unaided eye can scarcely see it, has its work to do in the world, and does it."—REV. J. G. Wood.

The following characterization of the family is adapted from the pages of Sir George F. Hampson's "Moths of India," Vol. I, p. 432:

' A family of moths generally of nocturnal flight, though some genera, as Aroa of the Eastern Hemisphere and Hemerocampa, are more or less diurnal in their habits. The perfect insects are mostly clothed with long hair-like scales upon the body. The males have the antennæ highly pectinated, the branches often having long terminal spines, and spines to retain them in position. The females often have a largely developed anal tuft of hair for covering the eggs. The proboscis is absent. The legs are hairy. The frenulum is present, except in the genus Ratarda, which does not occur in America. The fore wing with vein 1a not anastomosing with 1b; 1c absent except in Ratarda; 5 from close to lower angle of cell. Hind wing with two internal veins; 5 from close to lower angle of cell, except in the eastern genera Gazalina and Porthesia, 8 nearly touching 7 at middle of cell and connected with it by a bar.

Larva hairy; generally clothed with very thick hair or with thick tufts of hair, and forming a cocoon into which these hairs are woven, they being often of a very poisonous nature.'

Genus GYNÆPHORA Hübner

(1) Gynæphora rossi Curtis, Plate XXXVIII, Fig. 10, ♂, Fig. 11, ♀.

The genus is arctic, and the species is found in the arctic
Liparidæ

regions of America, the specimens figured having been received by the writer from Point Barrow in Alaska.

Genus NOTOLOPHUS Germar

(1) Notolophus antiqua Linnaeus, Plate XXXVIII, Fig. 18, ♂.  
Syn. nova Fitch.
The moth is found in Europe and in the northern portions of the United States and in Canada.

Genus HEMEROCAMPA Dyar

The females in this genus are wingless, or have the wings at most rudimentary. The eggs are deposited in masses, generally upon the surface of the cocoon from which the female has emerged. The larvæ are voracious feeders; and as the species are generally very prolific, the insects inflict a great deal of damage upon vegetation.

(1) Hemerocampa vetusta Boisduval, Plate XXXVIII, Fig. 19, ♂.  
Syn. cana Henry Edwards; gulosa Henry Edwards.  
The insect replaces on the Pacific coast the following species, which in its habits it closely resembles.

(2) Hemerocampa leucostigma Abbot & Smith, Plate XXXVIII, Fig. 20, ♂, Fig. 21, ♀. (The White-marked Tussock Moth.)  
Syn. leucographa Geyer; intermedia Fitch; borealis Fitch; obliviosa Henry Edwards.  
The moth is widely distributed in the Appalachian subregion, and its ravages upon shade-trees and shrubbery are matter of familiar observation. The insect is double-brooded in the more northern portions of its range, and triple-brooded farther south. The first generation is matured from eggs which, having been deposited in the fall of the year, remain in situ upon the cocoons upon which they were deposited until they are hatched by the heat of the sunshine of spring. The caterpillars rapidly develop, and the second generation, which is always much more numerous than the first, begins to appear about the middle of July in the latitude of New York and Philadelphia.
A third generation follows in the month of September. This generation lays the eggs from which the larvæ which appear in the following spring are hatched.

The female, as has already been stated, is wingless, and lives solely for the purpose of oviposition. Having laid her eggs, which she covers with the hairy scales which she plucks from the abdomen, and mingles with a viscid secretion, which she deposits with the eggs, and which on drying becomes hard and brittle, she dies. The young larva on being hatched has the power of spinning a thin thread of silk, with which it lowers itself from its resting-place when disturbed, and by means of which it regains the place from which it has dropped. This power is lost as the insect develops after successive molts. The mature caterpillar is a rather striking and not unbeautiful creature. The head is brilliant vermilion in color; the body is white banded with black, and adorned with black-tipped tufts and bundles of cream-colored hairs. There is considerable disparity in the size of the larvæ and the pupæ of the two sexes, as is partially shown in Fig. 183. The larva and the pupa of the female moth are generally twice as large as those of the male.

The best means of combating the ravages of this insect is to see to it that in the fall and winter the cocoons, which may be found adhering to the twigs of trees and shrubs and secreted in the nooks and crannies of fences, are gathered together and destroyed. It is also useful to spray the young foliage of trees which are liable to attack with any one
Liparidæ

of the preparations which are made by reputable firms for the purpose of destroying the larvæ of this and other destructive insects which attack our shade-trees. The spraying should take place at intervals when the young larvæ are observed to be moving upward upon the trunks of the trees.

(3) Hemerocampa definita Packard, Plate XXXVIII, Fig. 17, ♂.

This species, which is closely allied to the last, is found in the northern Atlantic States. What has been said as to the habits of H. leucostigma applies also to this insect.

Genus OLENE Hübner

(1) Olene achatina Abbot & Smith, Plate XXXVIII, Fig. 9, ♂.

Syn. parallela Grote & Robinson; tephra Hübner; cinnamomea Grote & Robinson.

The moth, which is somewhat variable in the style and intensity of the dark markings upon the wings, is found in the Appalachian subregion, but is somewhat more frequent in the south than in the north.

(2) Olene leucophaea Abbot & Smith, Plate XXXVIII, Fig. 7, ♂, Fig. 8, ♀.

Syn. basiflava Packard; atrivenosa Palm; manto Strecker.

This is likewise a variable insect, the range of which is practically coincident with that of the last-mentioned species.

Genus PORTHETRIA Hübner

(1) Porthetria' dispar Linnaeus, Plate XXXVIII, Fig. 12, ♂, Fig. 13, ♀. (The Gypsy Moth.)

This well-known insect is a native of the Old World. A number of years ago, a gentleman interested in entomology, and residing at the time in Cambridge, Massachusetts, received from a friend in Europe a number of cocoons of the moth, from which the insects in due season emerged. A few of the number were prepared and mounted in his cabinet, and the remainder were allowed to escape through the window of the room in which they were. Unchecked by the presence of parasites, which in their native habitat keep their numbers down, they rapidly multiplied and became a scourge. Fully a million of dollars has thus far been expended in the effort to exterminate them. In spite of
all the exertion which has been put forth, the insect appears to have obtained a permanent foothold in the New England States, though in recent years the destruction wrought has not been very great, owing to the incessant vigilance which is maintained by the civic authorities in repressing the nuisance.

Genus PSILURA

(1) Psilura monacha Linnaeus, Plate XXXVIII, Fig. 14, ♂, Fig. 15, ♀.

This is another insect which is said to have been imported from Europe, and is reputed to have found a foothold on the soil of the New World. The specimens figured on our plate are from a brood which the writer is informed by Mr. George Franck, of Brooklyn, to have been found in the eastern suburbs of that place. Mr. Franck has assured me that it is certainly already well domiciled in the region.

Genus EUPROCTIS Hübner

(1) Euproctis chrysorrhœa Linnaeus, Plate XXXVIII, Fig. 16, ♂. (The Brown-tail Moth.)

This insect, like the two preceding species, is an importation from Europe. It has become domiciled in the vicinity of Boston, Massachusetts, and is very common in the vicinity of Magnolia, Beverly Farms, and Manchester-on-the-Sea.

Genus DOA Neumægen & Dyar

The only species of the genus, named ampla by Grote, is a native of Colorado, and ranges thence southward through Arizona to the higher mountain plateaus of Mexico. It also occurs not infrequently in northwestern Texas. It may easily be recognized with the help of the accompanying cut, which is drawn from a specimen in the collection of the writer.

“Maidens, like moths, are ever caught by glare,
And Mammon wins his way where seraphs might despair.”

BYRON.—Childe Harold, Canto I.
Genus LEUCULODES Dyar

The genus is thus far represented in our fauna by but a single species, to which Hulst applied the specific name lacteolaria. It is a native of Arizona. The figure which is here-with given was drawn by the writer from the type which is preserved in the United States National Museum.

MOTH-SONG

"What dost thou here,
Thou dusky courtier,
Within the pinky palace of the rose?
    Here is no bed for thee,
    No honeyed spicery,—
    But for the golden bee,
    And the gay wind, and me,
    Its sweetness grows.
    Rover, thou dost forget;—
    Seek thou the passion-flower
    Bloom of one twilight hour.
    Haste, thou art late!
    Its hidden savors wait.
    For thee is spread
    Its soft, purple coverlet;
    Moth, art thou sped?
    —Dim as a ghost he flies
    Thorough the night mysteries."

ELLEN MACKAY HUTCHINSON CORTISSOZ
FAMILY LASIOCAMPIDÆ

"Now busily convened upon the bud
That crowns the genial branch, they feast sublime,
And spread their muslin canopy around,
Pavilioned richer than the proudest kings."

The Lasiocampidæ have been characterized as follows by Sir George F. Hampson, in "The Moths of India," Vol. I, p. 402:

"Moths mostly of large size. Palpi porrect and generally large. Proboscis absent; eyes small; antennæ bipectinate in both sexes; legs generally with minute terminal pairs of spurs to mid and hind tibiae and rather hairy. Fore wing with vein 1a not forked with b; 1c rarely present; the cell medial in position; veins 6 and 7 from the angle; veins 9 and 10 always stalked and from before the angle. Hind wing with two internal veins; 6 and 7 arising very near the base; 8 curved and almost touching 7, or connected with it by a bar, thus forming a precostal cell; accessory costal veinlets generally present. Frenulum absent.

Larva with lateral downwardly-directed tufts of hair, and often subdorsal tufts or dorsal humps on anterior somites thickly clothed with hair.

Cocoon closely woven of silk and hair."

Seven genera belonging to the family are recognized as occurring within our faunal limits.

Genus GLOVERIA Packard

(1) Gloveria arizonensis Packard, Plate XLI, Fig. 3, ♂.
Syn. dentata Henry Edwards.
The moth is found in Arizona and northern Mexico.

(2) Gloveria psidii Sallé, Plate XLI, Fig. 2, ♂.
The habitat of the species is the same as that of the foregoing.

(3) Gloveria howardi Dyar, Plate XLI, Fig. 1, ♀.
The specimen figured on the plate is one of several which are contained in the collection of the United States National Museum,
Lasiocampidae

and which constituted the material upon which the original description of the species was based by Dr. Dyar.

Genus ARTACE Walker

(1) Artace punctistriga Walker, Plate XII, Fig. 5, ♂.

Syn. rubripalpis Felder.

This rather rare little moth has its habitat in the southern Atlantic States.

Genus TOLYPE Hübner

Five species are accounted as belonging to this genus. We give illustrations of the one which is commonest.

(1) Tolype velleda Stoll, Plate XI, Fig. 7, ♂, Fig. 8, ♀.

The species is found throughout the Appalachian subregion.

Genus HYPOPACHA Neumœgen & Dyar

The only species known to belong to this genus was named grisea by Neumœgen. The only specimen of which the writer has knowledge is the type which is contained in the collection of the Brooklyn Institute. Of this I have, through the kindness of the authorities of that institution, been permitted to make a drawing, which is reproduced in the annexed cut. The habitat of the species is Arizona.

Genus MALACOSOMA Hübner

(1) Malacosoma americana Fabricius, Plate X, Fig. 12, ♀.

Syn. decipiens Walker; frutetorum Boisduval.

The species, which is commonly known as "The American Tent-caterpillar," is widely distributed throughout the Appalachian subregion, and at times inflicts considerable injury upon the foliage of trees. It especially affects trees belonging to the Rosacea, as the wild cherry and wild plum, and attacks apple-orchards with avidity. The great white webs woven by the caterpillars are familiar objects in the rural landscape, detested by the fruit-grower, and equally despised by the man who loves to see trees in perfect leaf. An orchard cobwebbed by the tent-caterpi-
lar is not pleasant to contemplate. The best way to combat these destructive insects is to diligently search for their webs when they first are being formed, and to cut off the branches to which they are attached and burn them. By following this method carefully, their ravages may be held in check.

(2) **Malacosoma californica** Packard, Plate X, Fig. 11, δ.

Syn. *pseudestria* Boisduval.

The species, which is in its habits very closely allied to the preceding, has its home upon the Pacific coast.

(3) **Malacosoma disstria** Hübner, Plate X, Fig. 9, δ; form *erosa* Stretch, Plate X, Fig. 10, δ.

Syn. *sylvestra* Harris; *drupacearum* Boisduval; *thoracoides* Neumoegen & Dyar; *sylvaticoides* Neumoegen & Dyar; *thoracica* Stretch; *persbera* Neumoegen & Dyar.

The moth is universally distributed through the United States and Canada. It appears to be rather variable, and a number of subspecies or varietal forms have been recognized. Many of the races, if such they can be called, differ so little from the typical stock that it hardly appears worth while to regard the names which have been applied to them as other than synonyms.

The habits of the larvae are almost identical with those of the species to which reference has already been made. Like them, they prefer to attack the
Lasiocampidae

Rosacea, although they also at times feed upon other trees. The hickories of various species and the walnuts are not exempt from their ravages. The writer has never observed them feeding upon oaks, birch, or beeches. An excellent account of the habits of these creatures may be found in Riley's Missouri Reports, Number III, from which the illustrations here given have been taken. The means of holding the insects in check are the same which have been recommended in the case of M. americana.

Genus HETEROPACHA Harvey

(1) Heteropacha rileyana Harvey, Plate VIII, Fig. 7 ♀.

The moth is not uncommon in the Valley of the Mississippi, ranging from western Pennsylvania to Kansas and Missouri, and southward into Texas.

Genus EPICNAPTERA Rambur

(1) Epicnaptera americana Harris, Plate XLI, Fig. 19, ♂, Fig. 20, ♀.

Syn. occidentis Walker; carpinifolia Boisduval.

There are a number of color forms of this insect which have received names, and which appear to be local races of some measure of stability in the regions where they occur. We have given in our plate the form which is common in the Mississippi Valley. The specimens figured were bred from larvae reared by Mr. Tallant at Columbus, Ohio.

"The Baron was an entomologist. Both the Fontenettes thought we should be fascinated with the beauty of some of his cases of moths and butterflies."

G. W. Cable
Explanation of Plate XLI

(Unless otherwise indicated, the specimens figured are contained in the collection of W. J. Holland.)

1. Gloveria howardi Dyar, ♀, U. S. N. M.
2. Gloveria psidii Sallé, ♂, U. S. N. M.
3. Gloveria arizonensis Packard, ♀, U. S. N. M.
5. Citheronia sepulchralis Grote & Robinson, ♀.
6. Oreta irrorata Packard, ♀.
7. Falcaria bilineata Packard, ♀.
12. Thyridopteryx ephemeraeformis Haworth, ♂.
14. Sthenopis argenteomaculatus Harris, ♂.
15. Hepialus hyperboreus Mæschler, ♂, U. S. N. M.
16. Hepialus lemberti Dyar, ♂, U. S. N. M.
17. Cicinnus melsheimeri Harris, ♀.
18. Aon noctiformis Neumoegen, ♂.
19. Epicnaptera americana Harris, ♂.
20. Epicnaptera americana Harris, ♀.
22. Drepana genicula Grote, ♂.
FAMILY BOMBYCIDÆ

"And thou, the insect of an hour,
O'er Time to triumph wouldst pretend;
With nerves of grass wouldst brave the power
Beneath which pyramids must bend!"

Carl Gustaf Af Leopold.

The Bombycideæ were originally confined to the Asiatic continent, and more particularly to the southeastern portions of that great land mass. The family is quite small and includes only a few genera. Of these the genus Bombyx is the only one which is well known. The family has been characterized as follows by Sir George F. Hampson, in "The Moths of India," Vol. I, p. 31:

"Proboscis absent, palpi rather small or absent; antennæ bipectinated in both sexes; legs hairy, without spurs. Frenulum absent; vein 5 of both wings from or from above the middle of the discocellulares; veins 7, 8, and 9 of the fore wing generally more or less bent downward; vein 1a forming or not forming a fork with 1b; 1c absent or present. Hind wing with two or three internal veins; vein 8 arising from the base of 7, or free from the base with a bar between them; the inner margin irregular and in part turned over.

Larva elongate and not hairy; dorsal humps on some of the somites, or a horn on the terminal somite, or paired dorsal spines.

Cocoon formed of fine silk of great commercial value."

Genus BOMBYX Linnaeus

(1) Bombyx mori Linnaeus.
The silk-worm of commerce is not known to exist in a feral or wild state in the regions where it is now most commonly
Bombycidae

reared. In this respect it is like many other domesticated animals. The caterpillar, of which a figure is herewith given, feeds upon

the leaves of the white mulberry, and will also feed freely upon the leaves of the Osage orange, an American hedge-plant. The insect was introduced at an early date into the American colonies, but its culture has not as yet risen in the New World to great proportions, though the manufacture of silk from imported material is at the present day an important American industry.

The culture of silk is an industry which might be best undertaken and maintained in the Southern States of the American Union, where climatic conditions are wholly favorable to it. The Carolinas and Georgia appear to furnish the best climate for the development of this industry, and it is believed by those who are most conversant with the matter that in time the rearing of the silkworm may become in these States an exceedingly important and profitable branch of industry. Southern California and Arizona are also likely to become centers in which the growing of raw silk may be successfully pursued.

THE HISTORY OF SILK-CULTURE

The greater portion of the silk of commerce is produced by the larvae of the moth known as *Bombyx mori*. The in
sect, through ages of human culture, has become thoroughly domesticated. It has been wrongly maintained that the moth known as *Theopila buttoni*, and which is found in China and western India, is the ancestral or feral form from which the domesticated *Bombyx mori* has been derived. The common silk-worm does not exist in a wild state anywhere so far as is known, and is as much a domestic animal as the Jersey cow or the grey-hound. Chinese literature clearly shows that the silk-industry originated in that country. The Emperor Hwang-Ti, whose reign was in the eighteenth century B.C., fostered the culture of silk, and his empress, Si-Ling-Chi, who gave her personal attention to the breeding of silk-worms and the manufacture of silk, was deified in consequence, and is reputed to be "the goddess of silk-worms." The methods of securing the silk and weaving fabrics from it were held secret by the Chinese for nearly two thousand years, and only after ages was a knowledge of the art transmitted to Corea, and thence to Japan. Silk in very small quantities was imported into Greece and Rome from China by way of Persia. Aristotle was the first writer in Europe to give a correct account of the manner in which silk is produced. He is supposed to have derived his information from those who had accompanied Alexander the Great on his victorious march into India. The price of silken fabrics in the West at the beginning of the Christian era, owing to the cost of transportation, was so great that only the very rich could possess garments of this material. Their use was restricted to wealthy women. For a man to use silken clothing was esteemed a sign of luxurious effeminacy. Under the reigns of Tiberius, Vespasian, and Diocletian the use of silken apparel by men was positively interdicted; but gradually, with the increase of importation of raw silk from Persia and its manufacture into stuffs in Asia Minor and elsewhere, the habit of using it grew, and its cost was slowly lowered. Under the reign of the Emperor Justinian, in the sixth century, positive steps to foster sericulture as an imperial monopoly were taken. Silk-loomss operated by women were established in the palace at Constantinople, and Justinian endeavored, in view of the loss of the supply of raw silk brought about by a war with Persia, to induce the Prince of Abyssinia to secure to him supplies of the article by a circuitous route. Relief was finally
brought to the embarrassed imperial manufacturer when two Nestorian monks, who had lived long in China and had learned all the processes of silk-culture, were induced to go back to that far-away land and bring to Constantinople a stock of the eggs of the silk-worm. As it was among the Chinese a capital offense to reveal the secrets of the trade or to export the eggs from which the worms are hatched, the two priests had to proceed with the utmost caution. They concealed the eggs in the hollows of the bamboo staffs which they carried as pilgrims. From these eggs, thus transported to Constantinople in A.D. 555, all of the silk-worms in Europe, Africa, Asia Minor, and America until as recently as 1865 were descended. It was not until the last-mentioned year that any importation of fresh eggs of the silk-worm from China took place. Those two bamboo sticks held within themselves the germ of a vast industry, countless costly wardrobes, the raiment of kings, queens, and emperors, and untold wealth.

From the time of Justinian onward the growth of silk-culture in Greece and Asia Minor was rapid. It was introduced into Spain by the Saracens at the beginning of the eighth century. It found lodgment in Sicily and Naples in the twelfth century, and in the next century was taken up in Genoa and Venice. It was not begun in France until the latter part of the sixteenth century, but in the seventeenth century it made great progress in France, as well as in Belgium and Switzerland. The weaving of silk had begun at an earlier date than this in France, Germany, and England. Attempts made to introduce the culture of the mulberry-tree and of the silk-worm in Great Britain have always signally failed. The climate appears to be against the industry. James I, who had failed in his attempts to foster sericulture in England, undertook to plant the industry in Virginia in 1609. But the eggs and mulberry-trees he sent out were lost by shipwreck. In 1619 and the years immediately following the attempt was renewed, and the raising of silk-worms was enjoined by statute and encouraged by bounties. In spite of every effort, little came of the attempt, the colonists finding the growth of tobacco to be far more profitable. In Georgia and the Carolinas similar attempts were made, and from 1735 to 1766 there were exported to England considerable quantities of raw silk from these colonies. From
1760 onward the industry declined. Sericulture was at this time taken up in Connecticut and flourished there more than anywhere else for many years, though the raw silk was not exported, but woven on the spot into various fabrics. The production of raw silk in Connecticut for many years amounted to a sum of not less than $200,000 annually. In 1830 an effort was made to introduce into the United States the so-called Chinese mulberry (*Morus multicaulis*). A popular craze in regard to this plant and the profits of silk-culture was begotten. Fabulous prices were paid for cuttings of the *Morus multicaulis*, as much even as five dollars for twigs less than two feet in length. Hundreds of people came to believe that the possession of a grove of these trees would be the avenue to fortune. But in 1839 the bubble burst, and many persons who had invested the whole of their small earnings were ruined. It was discovered that the trees would not withstand frost and were practically worthless, as compared with the white mulberry (*Morus alba*). "Colonel Mulberry Sellers" remains in American literature a reminder of those days, and of the visionary tendencies of certain of our people.

The manufacture of silk thread and of silken fabrics was begun in the United States at an early date. Machinery for reeling, throwing, and weaving silk was invented, and the importation of raw silk was begun. The industry has steadily grown until at the present time silk-manufacture has come to be an important industry, in which nearly a hundred millions of dollars are invested. The annual production of silken goods amounts to a sum even greater than the capital employed and gives employment to seventy-five thousand persons. So much for the industrial importance of one small species of those insects to which this volume is devoted.

"It was brown with a golden gloss, Janette,
It was finer than silk of the floss, my pet;
'T was a beautiful mist falling down to your wrist,
'T was a thing to be braided, and jewelled, and kissed—
'T was the loveliest hair in the world, pet."

CHARLES G. HALPINE. — *Janette's Hair.*
FAMILY PLATYPTERYGIDÆ

"Above the wet and tangled swamp
White vapors gathered thick and damp,
And through their cloudy curtaining
Flapped many a brown and dusky wing—
Pinions that fan the moonless dun,
ut fold them at the rising sun."

Whittier.

The family has been described as follows by Sir George F. Hampson, "Moths of India," Vol. I, p. 326:

"Small or moderate-sized moths of somewhat slender build, generally with the apex of the fore wing falcate.
Palpi slender and slightly scaled, often very minute. Fore wing with vein 1b forked at the base; 1c absent; 5 from close to the lower angle of cell. Hind wing with one or two internal veins; 1a short when present; 5 from near lower angle of cell; the discocellulars angled; the origin of veins 6 and 7 before the angle of cell; 8 bent down and nearly or quite touching 7.

Larva smooth, with the anal prolegs absent, except in the genus Eucbera;* the anal somite usually with a long process, the others often humped.

Cocoon spun among leaves."

Genus EUDEILINEA Packard

The only species of the genus known in our fauna is the one named herminiata by Guenée. It is a rather rare little moth in collections, being probably overlooked by collectors on account of its insignificant size and its general resemblance to commoner species. It is found in the Appalachian subregion.

* Not American.
Genus ORETA Walker

(1) Oreta rosea Walker, Plate XLI, Fig. 24, ♀.
Syn. americana Herrich-Scheffer; formula Grote.
The moth is a native of the eastern portions of our territory.

(2) Oreta irrorata Packard, Plate XLI, Fig. 6, ♀.
The range of this species is coincident with that of the last.

Genus DREPANA Schrank

(1) Drepana arcuata Walker, Plate XLI, Fig. 23, ♂.
Syn. fabula Grote.
Form genicula Grote, Plate XLI, Fig. 22, ♂.
The species, which is dimorphic, inhabits the Appalachian subregion. The form genicula occurs in the spring, the form arcuata in the summer.

Genus FALCARIA Haworth

The genus is common to both hemispheres.

(1) Falcaria bilineata Packard, Plate XLI, Fig. 7, ♀.
The insect, which is by no means common, is a native of the eastern portion of our territory.

TRANSFORMATION

"Who that beholds the summer's glistening swarms,
Ten thousand thousand gaily gilded forms,
In volant dance of mix'd rotation play,
Bask in the beam, and beautify the day;
Who 'd think these airy wantons, so adorn,
Were late his vile antipathy and scorn,
Prone to the dust, or reptile thro' the mire,
And ever thence unlikely to aspire?
Or who with transient view, beholding,
Those crawling sects, whom vilest semblance cloaths;
Who, with corruption, hold their kindred state,
As by contempt, or negligence of fate;
Could think, that such, revers'd by wondrous doom,
Sublimer powers and brighter forms assume;
From death their future happier life derive,
And tho' apparently entomb'd, revive;
Chang'd, thro' amazing transmigration rise,
And wing the regions of unwonted skies;
So late depress'd, contemptible on earth,
Now elevate to heaven by second birth."

Henry Brooke.—Universal Beauty.

321
FAMILY GEOMETRIDÆ

"... The sylvan powers
Obey our summons; from their deepest dells
The Dryads come, and throw their garlands wild
And odorous branches at our feet; the Nymphs
That press with nimble step the mountain-thyme
And purple heath-flower come not empty-handed,
But scatter round ten thousand forms minute
Of velvet moss or lichen, torn from rock
Or rifted oak or cavern deep: the Naiads too
Quit their loved native stream, from whose smooth face
They crop the lily, and each sedge and rush
That drinks the rippling tide: the frozen poles,
Where peril waits the bold adventurer's tread,
The burning sands of Borneo and Cayenne,
All, all to us unlock their secret stores
And pay their cheerful tribute."  

J. Taylor.—Norwich, 1818.

The Geometridæ are a very large and universally distributed family of moths. There is no country where there is any vegetation where they do not occur. Even in the inhospitable regions of the far North, upon the verge of the eternal ice, they may be found. They are more or less frail in their habit, with considerable expanse of wing in proportion to the size of the body. They are semidurnal or crepuscular. They have been characterized as follows by Sir George F. Hampson:

"... Proboscis present or rarely absent. Legs and tarsi slender, elongate, and naked, or slightly clothed with hair. Fore wing with vein 1a forming a fork with 1b. 1c absent; vein 5 from or from above middle of the discocellulars, 7 rising from 8, 9. Hind wing with the frenulum usually present, but absent in a few genera. Vein 1a very short, apparently absent in some forms; vein 1b running to anal angle; 1c absent. 8 with a well-developed precostal spur.
Larvae with the three anterior pairs of abdominal claspers totally aborted, and progressing by bringing the posterior somites close to the thoracic, looping the medial somites. In a few ancestral forms there is tendency to develop additional prolegs and to a more ordinary mode of progression.

The larvae, which are commonly known as "measuring-worms," "span-worms," or "loopers," have the power in many cases of attaching themselves by the posterior claspers to the stems and branches of plants, and extending the remainder of the body outwardly at an angle to the growth upon which they are resting, in which attitude they wonderfully resemble short twigs. Dichromatism is often revealed among them, part of a brood of caterpillars being green and the remainder brown or yellowish. Various explanations of this phenomenon have been suggested. In not a few cases the females are wingless.

Over eight hundred species of Geometridae are known to occur within the limits of the United States and Canada, and when the region shall have been exhaustively explored, there is little doubt that this number will be greatly increased. It is impossible within the limits of this book to mention and depict all of these species. We have therefore confined ourselves to the description through our plates of one hundred and seventy species, which are either more commonly encountered, or are possessed of some striking character. Incidentally occasion has been taken to figure a few of the types of species in the collection of the author which have never before been delineated.

The student who desires to familiarize himself with the family with which we are now dealing will derive much assistance from the writings of Packard and Hulst, the titles of which he will find in the portion of the Introduction of this book devoted to the literature of the subject.

SUBFAMILY DYSPTERIDINÆ

Genus DYSPTERIS Hübner

(1) Dyspteris abortivaria Herrich-Schaeffer, Plate XLII, Fig. 21, δ. (The Bad-wing.)

This pretty little moth may be easily recognized by the fact that the hind wings are so much smaller than the fore wings.
Geometridae

It is the only species of the genus found within our territory. It is not uncommon in the Appalachian subregion.

Genus NYCTOBIA Hulst

Three species belong to this genus. One of them is selected for illustration.

(1) Nyctobia limitata Walker, Plate XLII, Fig. 22, $\delta$.
Syn. lobophorata Walker; vernata Packard.
The habitat of this moth is identical with that of the last-mentioned species. It is not at all uncommon in Pennsylvania.

Genus CLADORA Hulst

(1) Cladora atroliturata Walker, Plate XLII, Fig. 23, $\delta$.
(The Scribbler.)
Syn. geminata Grote & Robinson.
A neatly marked species, which is the sole representative of the genus in our fauna. The moths may be found in the early spring seated upon the trunks of trees in the forest. It is a native of the Appalachian subregion.

Genus RACHELA Hulst

Four species of this genus have been characterized by the late Dr. Hulst. The only one which occurs in the eastern portions of the continent we figure.

(1) Rachela bruceata Hulst, Plate XLII, Fig. 24, $\delta$.
The moth is found in the northern Atlantic States. It is not uncommon in western Pennsylvania.

SUBFAMILY HYDRIOMENINÆ

Genus PALEACRITA Riley

There are reputed to be three species of the genus found in the United States. Only one of them, because of its economic importance, has received much attention thus far.

(1) Paleacrita vernata Peck, Plate XLII, Fig. 25, $\delta$, Fig. 26, $\varphi$. (The Spring Canker-worm.)
Syn. sericeiferata Walker; autumnata Packard; merricata Dyar.
There are two insects known as canker-worms. One of these, the smaller of the two, is properly named the Spring
Canker-worm, because the great majority of the moths issue from the ground in the spring. It has been a great pest in orchards, and formerly in our Eastern cities was a nuisance, not only because of the injury which it inflicted upon the foliage of shade-trees, but because of the annoying manner in which the larvae, pendent from the branches by long threads of silk, were blown about over things and persons beneath them. It was to effect their destruction that the English sparrow was originally imported into this country. The ravages of the insects upon the foliage of trees in parks and gardens have measurably decreased since this step was taken, but in the open country, especially in the Valley of the Mississippi, the insects are still numerous enough to do much harm to orchards. The females being apterous, the best method of preventing the multiplication of the insects upon trees is to prevent them from climbing up upon the foliage and ovipositing. A simple device, which has proved very effective, is to tie a piece of rope about the trunk of the tree which it is intended to protect, and to insert between the rope and the bark strips of tin, which, having been put into place, should be bent downwardly and outwardly, so as to form a collar with a downward flare. The insects have been found not to be inclined to pass such a barrier, and they will congregate just below it, and may there be captured and destroyed. Birds are the chief enemies of the canker-worm, and every wise orchardist will see to it that all species of insectivorous birds are not molested in his neighborhood, but are encouraged to find in his trees a hospitable welcome. The small amount of fruit which the birds take as toll is amply compensated for by the work which they perform in keeping down insect pests, such as

FIG. 195. — *Paleacrita vernata*. *a*, mature larva; *b*, egg, magnified, natural size shown in mass at side; *c*, enlarged segment of larva, side view; *d*, do., viewed dorsally. (After Riley.)

Fig. 196.—*Paleacrita vernata*. *a*, male; *b*, female; *c*, joint of antenna; *d*, joint of abdomen; *e*, ovipositor. (After Riley.)

325
the one under consideration. It is the part of wisdom in every way to protect the birds.

The canker-worm is widely distributed from the Atlantic to the Pacific.

**Genus ALSOPHILA Hübner**

Only one species of the genus occurs within our limits.

(1) *Alsophila pometaria* Harris. (The Fall Canker-worm.)

Syn. *restitnens* Walker.

The Fall Canker-worm in many respects closely resembles the preceding species, but a critical eye can at once detect great differences both in the form and markings of the caterpillar and of the mature insect. The moths generally emerge from the pupal state in the late fall, or during mild spells of weather in the winter, and may even continue to come forth until the spring is well advanced. The eggs are not laid as those of the preceding species, singly under the scales of bark, but are deposited in a compact mass fastened to the twigs by a strong gluey secretion, and are loosely covered with gray hairs, which the female rubs from her abdomen. The caterpillars are not ornamented on the back by a multitude of fine lines, but have a broad brown stripe along the dorsal line. The moths are larger than those of the Spring Canker-worm, and have a distinct whitish spot on the costa of the primaries near the apex. The caterpillar undergoes but two molts, and matures very rapidly. It has rudimentary prolegs on the eighth somite. The precautionary measures which have proved effective in combating the Spring Canker-worm are not efficacious in dealing with this species. To effectively destroy them the best means is to spray the foli-
age, just as the buds are opening, with some one of the poisonous mixtures which are prepared as insecticides. One of the very best means of keeping down the ravages of the insects is to encourage the cherry-birds (*Ampelis*) to stay about the place. They wage relentless war upon the pests.

**Genus EUDULE Hübner**

(1) *Eudule mendica* Walker, Plate XLII, Fig. 27, ♂. (The Beggar.)

*Syn. biseriata* Herrich-Schaeffer.

This delicate little moth is widely distributed throughout the Appalachian subregion. It has been commonly placed in the genus *Euphaessa*.

(2) *Eudule unicolor* Robinson, Plate XLII, Fig. 28, ♂. (The Plain-colored Eudule.)

The insect, which has been in most lists attributed to the genus *Ameria*, ranges from Colorado to Texas and Arizona.

**Genus NANNIA Hulst**

(1) *Nannia refusata* Walker, Plate XLII, Fig. 31, ♀. (Harvey’s Geometer.)

*Syn. harveiata* Packard.

This is a common species in the spring of the year in the northern Atlantic States.

**Genus HETEROPHLEPS Herrich-Schaeffer**

(1) *Heterophleps triguttaria* Herrich-Schaeffer, Plate XLII, Fig. 29, ♂. (The Three-spotted Fillip.)

*Syn. quadrinotala* Walker; *hexaspilata* Walker.

This pretty little moth is widely distributed throughout the entire United States, and is very generally associated with the preceding species in locality and time of appearance.

**Genus TEPHROCLYSTIS Hübner**

This is a very extensive genus, composed for the most part of small and inconspicuous species. It is found in both hemispheres. We select, for purposes of illustration, one of the commoner species, which is found in both Europe and America.
Geometridæ

(1) **Tephroclystis absinthiata** Clerck, Plate XLII, Fig. 32, ♂. (The Absinth.)

Syn. *minutata* Treitschke; *notata* Stephens; *elongata* Haworth; *abynthiata* Guenée; *coagulata* Guenée; *geminata* Packard.

This inconspicuous little creature illustrates the truth of the remark, already made, that the smaller the insect the more and the lengthier the names which it bears or which have been imposed upon it.

**Genus EUCYMATOGE** Hübner

(1) **Eucymatoge intestinata** Guenée, Plate XLII, Fig. 30, ♀.

Syn. *impleta* Walker; *indoctrinata* Walker.

The moth is almost universally distributed throughout the United States. It is found in the spring of the year seated upon the trunks of trees, the gray bark of which it assimilates in color.

**Genus VENUSIA** Curtis

The genus is common to both hemispheres. *Venusia cambrica* Curtis is found in Europe and the United States. Two other species of the genus occur in our territory, and of both of these we give figures.

(1) **Venusia duodecimlineata** Packard, Plate XLIII, Fig. 15, ♂.

The moth is very widely, if not universally, distributed throughout temperate North America.

(2) **Venusia comptaria** Walker, Plate XLII, Fig. 33, ♂.

Syn. *condensata* Walker; *inclinataria* Walker; *inclinata* Hulst; *perlineata* Packard.

The species is common in the eastern portions of the United States.

**Genus EUCHŒCA** Hübner

(1) **Euchœca albovittata** Guenée, Plate XLIV, Fig. 19, ♂. (The White-striped Black.)

The moth is found from the Atlantic to the Pacific and ranges well up into Alaska, whence I have obtained specimens taken at Sitka and on Lake Labarge, in the Valley of the Yukon.

(2) **Euchœca californiata** Packard, Plate XLIV, Fig. 20, ♂. (The Californian Black.)

The moth inhabits the Pacific States.

328
(3) *Euchœca lucata* Guenée, Plate XLIV, Fig. 6, ♂. (The Woodland Black.)

The insect is distributed from western Pennsylvania and West Virginia to Illinois, and northward to Manitoba. It is not rare about Pittsburgh.

**Genus HYDRIA Hübner**

(1) *Hydria undulata* Linnaeus, Plate XLII, Fig. 34, ♀. (The Scallop-shell Moth.)

This neatly marked species is found in both Europe and America. It is the only species of the genus in the United States.

**Genus PHILEREME Hübner**

The species of this genus are all Western in their habitat.

(1) *Philereme californiata* Packard, Plate XLII, Fig. 36, ♂. The specimen figured was taken on the slopes of Mt. Shasta.

**Genus EUSTROMA Hübner**

This is quite an extensive genus found in both the New World and the Old. Of the nine species recognized thus far as occurring within the United States, we figure three.

(1) *Eustroma diversilineata* Hübner, Plate XLII, Fig. 42, ♂. (The Diverse-line Moth.)

The moth is not at all uncommon in the Appalachian subregion.

(2) *Eustroma prunata* Linnaeus, Plate XLII, Fig. 53, ♂. (The Plum Moth.)

Syn. *ribesiaria* Boisduval; *triangulatum* Packard; *montanatum* Packard.

The insect is found in both Europe and North America.

(3) *Eustroma atrocolorata* Grote, Plate XLII, Fig. 43, ♂. (The Dark-banded Geometer.)

A denizen of the Appalachian subregion. It is one of the most beautiful of the geometrid moths found in the Atlantic States.

**Genus RHEUMAPTERA Hübner**

A genus of moderate size, the species of which are found in the temperate and boreal regions of both hemispheres.

(1) *Rheumaptera hastata* Linnaeus, Plate XLII, Fig. 40, ♂, Fig. 41, ♀, var. (The Spear-mark.)

The species is very variable, and half a dozen forms have been named. The only differences existing between these forms are
in the relative amount of black and white upon the upper side of the wings. The moth is found all through northern Europe and Asia, and is widely distributed through the northern United States and Canada as far west as Alaska, where it is very common.

(2) Rheumaptera luctuata Denis & Schiffermüller, Plate XLII, Fig. 39, ♂.

The remarks made as to the preceding species apply equally well to the present. I have received it in recent years in great numbers from Alaska.

(3) Rheumaptera rubrosuffusata Packard, Plate XLII, Fig. 38, ♂.

The moth is a native of the Pacific States.

**Genus PERCNOPTILOTA Hulst**

This genus is represented in North America by a single species, *Percnoptilota fluviata* Hüblner, which is shown on Plate XLII, Fig. 48, by a male specimen. The moth also occurs in Europe and northern Asia, and has been described under at least fifteen different names. The synonymy is too extensive to burden the pages of this book with it.

**Genus MESOLEUCA Hübner**

This is an extensive genus found in the temperate regions of the northern hemisphere on both sides of the Atlantic.

(1) Mesoleuca ruficillata Guenée, Plate XLIII, Fig. 21, ♂.

The habitat of the species is the northern United States and southern Canada.

(2) Mesoleuca gratulata Walker, Plate XLII, Fig. 47, ♂.

Syn. brunneiciliata Packard.

The insect is found in the Pacific subregion.

(3) Mesoleuca lacustrata Guenée, Plate XLII, Fig. 50, ♀.

This is not an uncommon species in Europe and the northern portions of the United States and in Canada.

(4) Mesoleuca intermediata Guenée, Plate XLII, Fig. 49, ♀.

The moth occurs in the Atlantic States.

(5) Mesoleuca hersiliata Guenée, Plate XLII, Fig. 46, ♂.

Syn. flammifera Walker.

The home of the species is in the region of the Rocky Mountains. It is not uncommon in Colorado.
EXPLANATION OF PLATE XLII

(The specimens figured are contained in the Collection of W. J. Holland.)

1. Palithis asopialis Guenée, ♂.
2. Gaberasa ambigualis Walker, ♂.
12. Hypena humuli Harris, ♂.
15. Nyctola liminera Speyer, ♂.
16. Brepheis infans Meeschler, ♀.
17. Callelapryx dryopierata Grote, ♂.
20. Sphacelodes vulneraria Hübner, ♂.
22. Nyctobia limitata Walker, ♂.
27. Eudule mendica Walker, ♂.
29. Heterophileus trigitaria Herrich-Schaeffer, ♂.
30. Encynatoge intestinata Guenée, ♀.
32. Tephroclytis absilhilata Clerck, ♂.
33. Venusia comptaia Walker, ♂.
34. Hydria undulata Linnaeus, ♀.
35. Hydrionema latructa Walker, ♂.
37. Gypsocroa siestella Guenée, ♀.
38. Rheumaptera rubrosuffusa Packard, ♂.
39. Rheumaptera bictata Denis & Schiffermüller, ♂.
40. Rheumaptera hastata Linnaeus, ♂.
41. Rheumaptera hastata Linnaeus, var. ♂.
42. Eustroma diversilineata Hübner, ♂.
43. Eustroma atrocolorata Grote, ♂.
44. Gypsochroa designata Hufnagel, ♂.
45. Triphosa progressata Walker, ♂.
46. Mesoleuca hersiliata Guenée, ♂.
47. Mesoleuca gratulata Walker, ♂.
48. Perconoptila fluviata Hübner, ♂.
49. Mesoleuca intermediata Guenée, ♂.
50. Mesoleuca lacustrata Guenée, ♂.
51. Hydriomena communis Strömeier, ♂.
52. Hydriomena speciosa Packard, ♂.
53. Eustroma prunata Linnaeus, ♂.
54. Hydriomena serdulata Fabricius, ♂.
Genus HYDRIOMENA Hübner

This is a very extensive genus, which is well represented in the temperate portions of both the Eastern and the Western Hemisphere. There are nearly thirty species which have been reported to occur in our fauna.

(1) Hydriomena sordidata Fabricius, Plate XLII, Fig. 54, ♀.
   Syn. rectangulata Fabricius; bicolorata Borkhausen; birivata Borkhausen.
   The insect is found all over the northern United States and Canada, and is common in Europe. Various varietal forms have been described, based upon differences, more or less constant, in the markings of the wings.

(2) Hydriomena autumnalis Strömeyer, Plate XLII, Fig. 51, ♂.
   This is another species which is found in Europe, and also occurs in the Pacific subregion of North America. It has an extensive synonymy, for a knowledge of which the student may refer to Staudinger & Rebel’s Catalogue of the Moths of the Palæarctic Region, or to Dyar’s List.

(3) Hydriomena speciosata Packard, Plate XLII, Fig. 52, ♂.
   The home of this pretty species is in the southwestern portions of the United States. It occurs in Texas, Arizona, and southern California.

(4) Hydriomena latirupta Walker, Plate XLII, Fig. 35, ♂.
   Syn. lascinata Zeller.
   The insect is found almost everywhere in the United States and Canada.

(5) Hydriomena custodiata Guenée, Plate XLIII, Fig. 10, ♂, upper side; Fig. 11, ♂, under side.
   Syn. gueneta Packard.
   The moth is an inhabitant of the Pacific subregion.

Genus TRIPHOSA Stephens

(1) Triphosa progressata Walker, Plate XLII, Fig. 45, ♂.
   Syn. indubitata Grote; dubitata Packard.
   The species occurs in the northern portions of the Pacific subregion.

"Soft-buzzing Slander; silly moths that eat
An honest name."  Thomson.—Liberty, Pt. IV, 609.
Genus Cœnocalpe Hübner

This is a moderately large genus, almost all the species of which are found in the Pacific subregion or in the southwestern portions of the United States.

(1) Cœnocalpe gibbocostata Walker. Plate XLIII, Fig. 16, ♂.
   Syn. coenitata Walker; strigulosa Minot; aneiformis Harvey.
   The moth is one of the few species of the genus found in the Atlantic States.

(2) Cœnocalpe fervifacitaria Grote, Plate XLIII. Fig. 4, ♂.
   This rather pretty insect is found in the region of the Rocky Mountains.

Genus Marmopteryx Packard

(1) Marmopteryx marmorata Packard, Plate XLIII, Fig. 1, ♂. (The Marble-wing.)
   The insect ranges from Colorado in the east to California in the west.

Genus Gypsochroa Hübner

(1) Gypsochroa designata Huinagel, Plate XLII, Fig. 44, ♂.
   Syn. propignata Denis & Schiffermüller; propignaria Treitschke.
   The moth occurs in both Europe and North America.

(2) Gypsochroa sitellata Guenée. Plate XLII, Fig. 37, ♂.
   Syn. hastata Guenée; impauperata Walker; alborignata Packard.
   The species is quite widely distributed throughout the United States.

SUBFAMILY MONOCTENIINÆ

Genus Paota Hulst

(1) Paota fultaria Grote. Plate XLIII, Fig. 27, ♂.
   The habitat of the species is Arizona.

Genus Hæmatopsis Hübner

(1) Hæmatopsis grataria Fabricius, Plate XLIII, Fig. 2, ♂.
   (The Chickweed Moth.)
   Syn. sanitaria Hübner; successaria Walker.
   This common but none the less beautiful little moth is often seen by the road-sides, where it has the habit of clinging to the stems of grasses, and of flying up when the footsteps of the passer-by approach. It is a native of the Appalachian subregion,
and ranges from the Atlantic to the Mississippi and beyond. The larva feeds on chickweed.

**SUBFAMILY STERRHINÆ**

**Genus ERASTRIA Hübner**

(1) *Erastria amaturaria* Walker, Plate XLIII, Fig. 22, $\delta$.
This insect, which is not likely to be mistaken for anything else, is a native of the Appalachian subregion. It is common in Pennsylvania.

**Genus PIGEA Guenée**

(1) *Pigea mutilineata* Hulst, Plate XLIII, Fig. 3, $\delta$.
The insect is found in Arizona. The specimen figured is one of the types of the species which was loaned to Dr. Hulst, and upon which he based his description.

**Genus COSYMBIA Hübner**

(1) *Cosymbia lumenaria* Hübner, Plate XLIII, Fig. 12, $\delta$.
Syn. *pendulina* Guenée; *quadriannulata* Walker.
This is a common species in the Atlantic subregion.

**Genus SYNELYS Hulst**

This is a small genus containing eight or nine species, all of which are found in the Southern States, except two.

(1) *Synelys alabastaria* Hübner, Plate XLIII, Fig. 5, $\varphi$.
Syn. *reconditaria* Walker; *enucleata* Packard (non Guenée).
The moth is very common in the Appalachian subregion.

**Genus LEPTOMERIS Hübner**

(1) *Leptomeris quinquelinearia* Packard. Plate XLIII, Fig. 9, $\varphi$.
(The Five-lined Geometer.)
A common species everywhere in the United States.

(2) *Leptomeris sentinaria* Hübner. Plate XLIII, Fig. 14, $\delta$.
Syn. *spuraria* Christoph; *gracilior* Butler.
The habitat of this insect is the northern portion of the Appalachian subregion.

(3) *Leptomeris magnetaria* Guenée, Plate XLIII, Fig. 8, $\delta$.
(The Magnet Moth.)
Syn. *rubrolinearia* Packard; *rubrolinesta* Packard.
The insect is found in the Pacific subregion.
Geometridae

Genus EOIS Hübner

(1) Eois ptelearia Riley. (The Herbarium Moth.)

The moth which is the subject of consideration is interesting because of the fact that in recent years it has become known as a destructive herbarium pest. The larvae attack the flowers, to some extent the leaves, and also to a less extent the hard fruits and seeds of specimens collected in the Southwestern States and in Mexico. Their ravages were first detected at the United States National Museum in the year 1890. Strangely enough, they show no appetite for species belonging to the flora of the Eastern and Northern States. It is believed that the insect is native to the region the plants of which it devours, but thus far no entomologist has reported its occurrence in the section of country from which it is supposed to come. The damage it is able to inflict upon specimens is very great, because of the very rapid multiplication of individuals which takes place.

An exceedingly interesting account of the insect and its

Fig. 199.—Eois ptelearia. a, larva, from side; b, do., from above; c, side view of abdominal segment; d, tubercle of same; e, pupa; f, cremaster; g, abdominal projection. All figures greatly enlarged. (After C. V. Riley, "Insect Life," Vol. IV, p. 109.)
destructive work was given by the late Professor C. V. Riley in "Insect Life," Vol. IV, p. 108 et seq. From this article the cuts which are herewith given have been extracted. Botanists cannot too carefully guard against this and other insect plagues which multiply in their collections. A solution of corrosive sublimate and arsenic, such as is commonly employed for poisoning herbarium specimens, will do much to prevent the ravages of the larvæ; but, as is pointed out by Professor Riley in the article to which reference has been made, additional safety from attack will be secured if all specimens, as they are received in the herbarium, are subjected to at least twenty-four hours' exposure to the fumes of bisulphide of carbon in an air-tight box or receptacle. This substance, as experience has shown, is destructive to all forms of insect life. Care should, however, be exercised in its use, as the fumes mixed with atmospheric gases make a highly explosive compound. The operation should never be undertaken in the presence of flame. It is not even safe to allow the fumes of carbon bisulphide to mingle in large quantity with the atmosphere of an apartment which is lighted by electricity. Accidental sparking, owing to some defect of the wires, may cause an explosion. Several bad accidents have occurred from the use in careless hands of this otherwise most valuable insecticide.

(2) Eois ossularia Hübner, Plate XLIII, Fig. 7, 6.
The moth, which has an extensive synonymy, which we will omit, is widely distributed throughout the United States.

(3) Eois inductata Guenée, Plate XLIII, Fig. 6, 6.
Syn. consecntaria Walker; sobria Walker; suppressaria Walker.
Geometridæ

The species is indigenous in the Appalachian subregion.

(4) **Eois sideraria** Guenée, Plate XLIII, Fig. 13, $\delta$.

Syn. *californaria* Packard; *californiata* Packard; *pacificaria* Packard.

The species ranges over the northern portions of the United States.

**SUBFAMILY GEOMETRINÆ**

**Genus CHLOROCHLAMY S Hulst**

(1) **Chlorochlamys chloroleucaria** Guenée, Plate XLIII, Fig. 17, $\delta$.

Syn. *indiscriminaria* Walker; *densaria* Walker; *deprivata* Walker.

The insect ranges from the Atlantic to the Pacific. It is freely attracted to light in the evening.

**Genus EUCROSTIS Hübner**

(1) **Eucrostis incertata** Walker, Plate XLIII, Fig. 18, $\delta$.

Syn. *oporaria* Zeller; *gratata* Packard.

Not at all uncommon in the Appalachian subregion.

**Genus RACHEOSPILA Guenée**

A small genus, characteristic of the hot lands of the American continents. One species, *R. lixaria*, is found in the Appalachian subregion as far north as the Middle States; the four remaining species found within our territory have thus far been reported only from Florida.

(1) **Racheospila hollandaria** Hulst, Plate XLIII, Fig. 19, $\delta$.

The specimen depicted on the plate is the type of the species, which was taken by the writer on the upper waters of the St. Johns River.

(2) **Racheospila saltusaria** Hulst, Plate XLIII, Fig. 20, $\delta$.

The specimen depicted on the plate is likewise the type of the species and came from the same locality as the preceding species.

**Genus SYNCHLORA Guenée**

(1) **Synchlora liquoraria** Guenée, Plate XLIII, Fig. 23, $\delta$.

Syn. *tricoloraria* Packard.

A species which is very widely distributed throughout the United States.
Genus **ANAPLODES** Packard

(1) **Anaploides iridaria** Guenée, Plate XLIII, Fig. 24, ♂.
Syn. rectaria Grote.
The moth ranges from Colorado to California.

**SUBFAMILY FERNALDELLINÆ**

Genus **FERNALDELLA** Hulst

The genus is the only representative of the subfamily. There are two species in the genus, both of them natives of the region of the Rocky Mountains. One of these, originally named *fimetaria* by Grote & Robinson, and subsequently named *balesaria* by Zeller, is represented in the accompanying cut. It is a very common insect in central Texas as well as in Colorado and Arizona.

**SUBFAMILY ENNOMINÆ**

Genus **EPELIS** Hulst

(1) **Epelis truncataria** Walker, Plate XLIII, Fig. 26, ♀.
Syn. faxonii Minot.
This species, the only representative of the genus, ranges through the northern and cooler portions of the Appalachian subregion, westward to the Rocky Mountains.

Genus **EUFIDONIA** Packard

(1) **Eufidonia notataria** Walker, Plate XLIII, Fig. 25, ♂.
Syn. discopilata Walker; fidonata Walker; bicolorata Minot; quadripunctaria Morrison.
This neatly marked moth is found in the Appalachian subregion. It is the only species in the genus.

Genus **ORTHOFIDONIA** Packard

(1) **Orthofidonia semiclarata** Walker, Plate XLIII, Fig. 30, ♀.
Syn. viatica Harvey.
The moth is a native of the Atlantic States.
(2) **Orthofidonia vestaliata** Guenée, Plate XLIII, Fig. 31, ♂.
Syn. junctaria Walker.
Geometridae

The habitat of this insect is the same as that of the preceding species, but it ranges a little farther to the West, and has been reported from Colorado.

Genus DASYFIDONIA Packard

(1) Dasyfidonia avuncularia Guenée, Plate XLIII, Fig. 32, δ.

This very pretty moth occurs from Colorado to California. It is the sole species in the genus.

Genus HELIOMATA Grote

There are reputed to be three species in this genus. Two of them we figure.

(1) Heliomata infulata Grote, Plate XLIII, Fig. 28, ♂.

The habitat of the species is the Atlantic region of the continent.

(2) Heliomata cycladata Grote, Plate XLIII, Fig. 29, δ.

The moth ranges from the Atlantic States westward as far as Montana. It is nowhere very common.

Genus MELLILLA Grote

(1) Mellilla inextricata Walker, Plate XLIII, Fig. 33, δ.

Syn. xanthometata Walker; snoviaria Packard.

The insect is a native of the Atlantic States.

Genus CHLORASPILATES Packard

(1) Chloraspilates bicoloraria Packard, form arizonaria, Plate XLIII, Fig. 34, δ.

The moth is found in the region of the Rocky Mountains.

Genus PHYSOSTEGANIA Warren

(1) Physostegania pustularia Guenée, Plate XLIII, Fig. 35, δ.

A native of the Atlantic States, ranging westward into the Valley of the Mississippi.

Genus DEILINEA Hübner

(1) Deilinea variolaria Guenée, Plate XLIII, Fig. 36, ♂.

Syn. intentata Packard.
EXPLANATION OF PLATE XLIII

(The specimens figured are contained in the Collection of W. J. Holland.)

1. Marmopteryx marmorata
   Packard, ♂.
2. Haematopis grataria Fabricius, ♂.
3. Pigea multilineata Hulst, ♂,
   Type.
4. Triphosa fervifacaria Grote, ♂.
5. Synelys alabastaria Hübner, ♀.
7. Eois ocellularia Hübner, ♂.
8. Leptomeris magnetaria Guenée,
   ♀.
9. Leptomeris quinquelinearia
   Packard, ♀.
10. Hydriomena custodiata Guenée,
    ♂.
11. Hydriomena custodiata Guenée,
    ♀, lower side.
12. Cosymbia lumenaria Hübner, ♀.
14. Leptomeris sentinaria Hübner,
    ♂.
15. Venusia duodecimlineata
    Packard, ♂.
17. Chlorochlamys chloroleucaria
    Guenée, ♀.
19. Racheospila hollandaria Hulst,
    ♀, Type.
20. Racheospila saltusaria Hulst,
    ♂, Type.
21. Mesoleuca rufocillata Guenée,
    ♂.
22. Erastria amaturaria Walker, ♂.
23. Synchlora liquoraria Guenée, ♂.
27. Paota fultaria Grote, ♂.
29. Heliomata cycladata Grote, ♂.
30. Orthofidonia semiclarata Walker,
    ♀.
31. Orthofidonia vestaliata Guenée,
    ♂.
32. Dasysidonia avuncularia
    Guenée, ♂.
33. Mellilla xanthometata Walker,
    ♂.
34. Chloraspilates arisonaria Grote,
    ♂.
35. Physostegania pustularia
    Guenée, ♂.
36. Deilina variolaria Guenée, ♀.
37. Sciagrapha granitata Guenée, ♂.
38. Deilina behrensaria Hulst, ♂,
    Type.
40. Macaria praetomata Haworth,
    ♀.
41. Sciagrapha heliolithida Guenée,
    ♀.
42. Sciagrapha melistrigata Grote,
    ♂.
43. Macaria s-signata Packard, ♂.
44. Macaria cremiata Guenée, ♂.
45. Cymatophora ribaria Fitch, ♀.
46. Cymatophora inceptaria Walker,
    ♂.
47. Macaria hypathrata Grote, ♂.
48. Cymatophora successaria
    Walker, ♀.
49. Cymatophora coortaria Hulst,
    ♂, Type.
50. Cymatophora tenebrosata Hulst,
    ♂, Type.
51. Synpherta tri punctaria
    Packard, ♀.
52. Apacasia deflata Walker, ♂.
53. Catopyrrha dissimiliaria
    Hübner, ♂.
54. Catopyrrha coloraria Fabricius,
    ♂.
55. Enemera juturnaria Guenée, ♂.
56. Platea trilinearia Packard, ♂.
57. Platea californiaria Herrich-
    Scheffler, ♂.
58. Caripeta divisata Walker, ♂.
59. Philedia punctomacularia
    Hulst, ♂, Type.
60. Nepytia semiclusaria Walker,
    ♂.
Geometridae

The moth occurs quite commonly in the Atlantic subregion.

(2) Deilinea behrensaria Hulst, Plate XLIII, Fig. 38, ♂.
A native of the Pacific subregion. The specimen figured is one of the types.

Genus SCIAGRAPHIA Hulst

(1) Sciagraphia granitata Guenée, Plate XLIII, Fig. 37, ♂.
(The Granite Moth.)
This small moth, which is a common species in the Appalachian subregion, has been described under no less than nineteen names by various authors. The student who is curious as to the synonymy may consult Dyar's List.

(2) Sciagraphia heliothidata Guenée, Plate XLIII, Fig. 41, ♀.
(The Sun-flower Moth.)
Syn. ocellinata Guenée; restorata Walker; subcolubrata Walker; duplicata, Packard.
The moth occurs throughout the region of the Great Plains and the Rocky Mountains.

(3) Sciagraphia mellistrigata Grote, Plate XLIII, Fig. 42, ♂.
(The Honey-streak.)
The insect is found in the northern portions of the United States, and ranges westward and southward, being not at all uncommon in northern Texas and in Colorado.

Genus PHILOBIA Duponchel

(1) Philobia enotata Guenée, Plate XLIII, Fig. 39, ♂.
Syn. amulataria Walker; sectomaculata Morrison; notata Cramer (non Linnaeus).
The insect appears to be common everywhere throughout the United States and Canada.

Genus MACARIA Curtis

A considerable genus, represented in both hemispheres.

(1) Macaria s-signata Packard, Plate XLIII, Fig. 43, ♂.
The species occurs from Colorado westward to California.

(2) Macaria eremiata Guenée, Plate XLIII, Fig. 44, ♂.
Syn. retectata Walker; gradata Walker; retentata Walker; subcinetaria Walker.
The habitat of the species is the Appalachian subregion.

(3) Macaria hypæthrata Grote, Plate XLIII, Fig. 47, ♂.
The insect flies in Colorado and adjoining States.

(4) **Macaria præatomata** Haworth, Plate XLIII, Fig. 40, ♀.
Syn. *consepta* Walker.
Not a rare species in the Atlantic States.

(5) **Macaria glomeraria** Grote, Plate XLIV, Fig. 3, ♀.
The range of this species is the same as that of the preceding.

**Genus CYMATOPHORA** Hübner

(1) **Cymatophora ribearia** Fitch, Plate XLIII, Fig. 45, ♀.
(The Gooseberry Span-worm.)
Syn. *sigmaria* Guenée; *annisaria* Walker; *aniusaria* Walker; *grossulariata* Saunders.

The gooseberry and the currant are subject in the United States and Canada to the attack of various insects, which do a great deal of damage to them. One of the most frequent causes of injury to these plants are the larvæ of the Gooseberry Span-worm, which is represented in Fig. 204. It is, when mature, about an inch in length, bright yellow in color, marked with dark-brown spots upon the segments. The eggs, which are laid by the mature female at the end of June or the beginning of July, are very minute, but upon examination under the microscope are seen to be beautifully ornamented with deep pits or sculpturings. They are pale bluish-green. The eggs are attached by the female to the stems and branches of the plants, not far from the ground. Being almost microscopic in size, they readily elude observation, and this, it is known, accounts for the fact that the insects are often, by the transplantation of the shrubs, transferred from one locality to another in which they have been previously unknown. The eggs, having been laid, remain through the summer and fall and all of the succeeding winter in a dormant state, and do not hatch until early in the following spring, when the leaves are beginning to put out upon the bushes. As soon as the
Geometridæ

- eggs are hatched, the larvæ begin to feed upon the young leaves, and they mature very quickly, the rate of their development being marked by a corresponding devastation of the plants upon which they have established themselves. Pupation takes place at the end of May or in the beginning of June. The caterpillar burrows into the loose soil about the roots of the bushes, or simply crawls under loose leaves, and, without spinning a cocoon, undergoes transformation into a chrysalis, which is smooth and of a shining mahogany color. In this state the insects remain for about two weeks, when they emerge as moths, and the cycle of life is repeated.

The most effectual method of combating the larvæ is to sprinkle the bushes with powdered white hellebore. This is a good remedy, not only for the species we are considering, but for several other insects which are likely to occur upon the plants at the same time.

(2) Cymatophora inceptaria Walker, Plate XLIII, Fig. 46, ♂.
Syn. argillacearia Packard; modestaria Hulst.
A native of the Appalachian subregion.
(3) Cymatophora successaria Walker, Plate XLIII, Fig. 48, ♀.
Syn. perarcuata Walker.
Form coortaria Hulst, Plate XLIII, Fig. 49, ♂.
A widely distributed species, which is not at all uncommon in the Middle Atlantic States.
(4) Cymatophora tenebrosata Hulst, Plate XLIII, Fig. 50, ♂.
Geometridae

The specimen represented upon the plate is one of Dr. Hulst's types. The moth is found in Arizona.

**Genus SYMPHERTA Hulst**

(1) *Sympherta tripunctaria* Packard, Plate XLIII, Fig. 51, ♀.
The moth is found in northern California, and ranges northward into British Columbia.

**Genus APÆCASIA Hulst**

(1) *Apæcasia defluata* Walker, Plate XLIII, Fig. 52, ♂.
The habitat of the species is the northern portion of the Appalachian subregion.

**Genus CATOPYRRHA Hübner**

(1) *Catopyrrha coloraria* Fabricius, Plate XLIII, Fig. 54, ♂.
Syn. *accessaria* Hübner; *cruentaria* Hübner; *atropunctaria* Walker.
Form *dissimilaria* Hübner, Plate XLIII, Fig. 53, ♂.
The insect, which in the mature form presents many varietal differences, due to variation in the form and shade of the markings, is found in the Appalachian subregion.

**Genus ENEMERA Hulst**

(1) *Enemera juturnaria* Gueneé, Plate XLIII, Fig. 55, ♂.
The moth is found in the region of the Rocky Mountains, westward to California and northward to Alaska.

**Genus CARIPETA Walker**

(1) *Caripeta divisata* Walker, Plate XLIII, Fig. 58, ♂.
The insect is found in the Atlantic States.
(2) *Caripeta angustiorata* Walker, Plate XLIV, Fig. 2, ♀.
Syn. *piniaria* Packard.
The moth, which is as yet quite rare in collections, is, like the preceding species, a native of the Appalachian subregion.

**Genus PLATEA Herrich-Schæffer**

(1) *Platea californiaria* Herrich-Schæffer, Plate XLIII, Fig. 57, ♂.
Syn. *uncanaria* Gueneé.
The moth flies from Colorado to California.

(2) **Platea trilinearia** Packard, Plate XLIII, Fig. 56, $\delta$.  
Syn. **dulcearia** Grote.
The insect ranges from northern Wyoming to Arizona.

**Genus PHILEDIA** Hulst

(1) **Philedia punctomacularia** Hulst, Plate XLIII, Fig. 59, $\delta$.  
The insect, which is found in the Pacific States, is represented on the plate by a figure of the type.

**Genus NEPYTIA** Hulst

(1) **Nepytia nigrovenaria** Packard, Plate XLIV, Fig. 15, $\varphi$.  
The insect is a native of the Pacific subregion.
(2) **Nepytia semiclusaria** Walker, Plate XLIII, Fig. 60, $\delta$.  
Syn. **pulchraria** Minot; **pellucidaria** Packard; **pinaria** Packard.  
The moth occurs in the northern portions of the United States.

**Genus ALCIS** Curtis

(1) **Alcis sulphuraria** Packard, form **baltearia** Hulst, Plate XLIV, Fig. 1, $\delta$.  
This insect, which is somewhat variable, is represented in the plate by the type of the form to which the Rev. Dr. Hulst applied the name **baltearia**. The species is widely distributed throughout the United States.

(2) **Alcis metanemaria** Hulst, Plate XLIV, Fig. 5, $\delta$.  
The moth occurs in Arizona and southern California. The figure on the plate is that of the type of the species.

**Genus PARAPHIA** Guenée

(1) **Paraphia subatomaria** Wood, Plate XLIV, Fig. 10, $\delta$.  
Syn. **nubecularia** Guenée; **mammurraria** Guenée; **impropriata** Walker; **exsuperata** Walker.
Form **unipuncta** Haworth, Plate XLIV, Fig. 11, $\varphi$.  
Syn. **unipunctata** Guenée; **triplipunctaria** Fitch.  
The moth, which is variable in the shade of the wings and the markings, is found in the Appalachian subregion.

**Genus PTEROSPODA** Dyar

(1) **Pterospoda opuscularia** Hulst, Plate XLIV, Fig. 18, $\varphi$.  
The insect is a native of California. The specimen figured on
the plate is the type upon which Dr. Hulst based the description of the species.

**Genus CLEORA Curtis**

1. *Cleora pampinaria* Guenée, Plate XLIV, Fig. 4, ♂.
   Syn. *sublunaria* Guenée; *frugallaria* Guenée; *collecta* Walker; *tinctaria* Walker; *fraudulentaria* Zeller.

   The moth is a native of the Appalachian subregion, ranging from the Atlantic to the Mississippi and beyond.

2. *Cleora atrifasciata* Hulst, Plate XLIV, Fig. 8, ♀.

   The specimen figured on the plate is the unique type which was described by Hulst in "Entomologica Americana," Vol. III, p. 214. The species has been overlooked in Dyar's List.

**Genus MELANOLOPHIA Hulst**

1. *Melanolophia canadaria* Guenée, Plate XLIV, Fig. 7, ♂.
   Syn. *signataria* Walker; *imperfectaria* Walker; *contribaria* Walker.

   A common species in the early spring throughout the United States.

**Genus ECTROPIS Hübner**

1. *Ectropis crepuscularia* Denis & Schiffermüller, Plate XLIV, Fig. 9, ♂.

   This species, which is found alike in Europe and America, has an extensive synonymy, for a knowledge of which the student may refer to Dyar's List or to Staudinger & Rebel's Catalogue. The species is widely distributed throughout the continent of North America.

**Genus EPIMECIS Hübner**

1. *Epimecis virginaria* Cramer, Plate XLIV, Fig. 28, ♂, Fig. 29, ♀.
   Syn. *hortaria* Fabricius; *liriodendraria* Abbot & Smith; *disserptaria* Walker; *amplaria* Walker.

   The insect is found in the Appalachian subregion, but is far more common in the South than in the North. I have taken it in Pennsylvania on rare occasions, but it has been found in great abundance by me in Florida.
Genus LYCIA Hübner

(1) Lycia cognataria Guenée, Plate I, Fig. 17, larva; Plate XLIV, Fig. 13, ♂.
Syn. sperataria Walker.
This is a common species in the Atlantic States. The larva depicted on the plate is brown. In every brood there are many specimens of the larvae which are green, and some are even yellowish. The moth has in the vicinity of Pittsburgh latterly shown a fondness for ovipositing upon imported rhododendrons, and the caterpillars have proved troublesome.

Genus NACOPHORA Hulst

(1) Nacophora quernaria Abbot & Smith, Plate XLIV, Fig. 14, ♀.
The species is not as common as the last, but is not rare. It has the same habitat, being a native of the Appalachian subregion.

Genus APOCHEIMA Hübner

The genus is found in the boreal regions of both hemispheres. Only one species occurs in our fauna.
(1) Apocheima rachelae Hulst, Plate XLIV, Fig. 12, ♂.
(Rachel's Moth.)
The moth is found in Montana, Assiniboia, and northward to Alaska.

Genus CONIODES Hulst

(1) Coniodes plumigeraria Hulst. (The Walnut Spanworm.)
In recent years the groves of English walnuts in southern California have been found to be liable to the attack of a span-worm, which previously had been unknown or unobserved. The trees had up to that time been regarded as singularly immune from the depredations of insect pests, and considerable alarm and apprehension were felt when it was found that a small caterpillar had begun to ravage them. The insect feeds also upon the leaves of various rosaceous plants, and upon the oak. The taste for the foliage of the English walnut has evidently been recently acquired.
An excellent article upon these insects was published in 1897.
Geometridæ

by D. W. Coquillet in the "Bulletin of the United States Department of Agriculture," New Series, No. 7, p. 64. From this article we have taken the accompanying cuts, and from it we draw some of the facts herein set forth. In describing the insect Mr. Coquillet says: "The color of the caterpillar is a light pinkish gray, varied with a darker gray or purplish, or sometimes with black and yellow, but never marked with distinct lines; the piliferous spots are black or dark brown, and the spiracles are orange yellow, ringed with black, and usually situated on a yellow spot. The worms become full grown in the latter part of April or during the month of May; they then enter the earth to a depth of from two to four inches and form small cells, but do not spin cocoons.

The change to the chrysalis takes place shortly after the cells are completed, and the chrysalis remains unchanged throughout the entire summer and until early in the following year, when they are changed into moths, which emerge from the ground from the first week in January to the last week in March. The male moth
Geometridae

is winged, but the female is wingless and is so very different in appearance from the male that no one not familiar with the facts in the case would ever suspect both belong to the same species."

The best means of combating these pests has been found to be to spray the trees, when the caterpillars are just hatching, with a solution of Paris green and water, one pound of the poison to two hundred gallons of water.

Genus PHIGALIA Duponchel

(1) Phigalia titea Cramer, Plate XLIV, Fig. 16, δ.
Syn. titearia Gueneé; revocata Walker; strigataria Minot.
The species is found in the Appalachian subregion, and is very common in Pennsylvania.

Genus ERANNIS Hübner

(1) Erannis tiliaria Harris, Plate XLIV, Fig. 17, δ. (The Linden Moth.)
The species ranges from the Atlantic coast to the Rocky Mountains.

Genus CINGILIA Walker

(1) Cingilia catenaria Drury, Plate XLIV, Fig. 21, δ. (The Chain-streak Moth.)
Syn. humeralis Walker.
The range of this species is much the same as that of the one which has just been mentioned above.

Genus SICYA Guenée

(1) Sicya macularia Harris, Plate XLIV, Fig. 22, δ, Fig. 23, ♀, var.
This species has an extensive synonymy, the insects being variable in the amount of red which they show on the yellow ground-color of the wings. The student who wishes to go into these matters may consult Dyar’s List. The insect is very generally distributed throughout our territory.

Genus THERINA Hübner

(1) Therina endropiaria Grote & Robinson, Plate XLIV, Fig. 26, δ.

347
Geometridæ

A native of the Appalachian subregion.

(2) **Therina athasiaria** Walker, Plate XLIV, Fig. 27, ♂
   Syn. *sicaria* Walker; *seminudata* Walker; *seminudaria* Packard; *bibularia* Grote & Robinson.

The habitat of this species is the same as that of the preceding.

(3) **Therina fiscellaria** Guenée, Plate XLIV, Fig. 25, ♂
   Syn. *flagitaria* Guenée; *panisaria* Walker; *equaliaria* Walker.

The insect ranges from the Atlantic to Colorado.

(4) **Therina fervidaria** Hübner, Plate XLIV, Fig. 24, ♂
   Syn. *pultaria* Guenée; *sciata* Walker; *invexata* Walker.

The moth is quite common in the Atlantic States.

---

**Genus METROCAMPA** Latreille

(1) **Metrocampa praegrandaria** Guenée, Plate XLIV, Fig. 30, ♂
   Syn. *perlata* Guenée; *perlaria* Packard; *viridoperlata* Packard.

The home of the species is the northern part of the United States and southern Canada.

---

**Genus EUGONOBAPTA** Warren

(1) **Eugonobapta nivosaria** Guenée, Plate XLIV, Fig. 31, ♂
   (The Snowy Geometer.)
   Syn. *nivosata* Packard.

This is a very common species in the Appalachian subregion. It is particularly abundant in western Pennsylvania.

---

**Genus ENNOMOS** Treitschke

The genus is found in both Europe and America. Three species are attributed to our fauna, two of which we figure.

(1) **Ennomos subsignarius** Hübner, Plate XLIV, Fig. 35, ♂
   Syn. *niveosericeata* Jones.

The moth ranges from the Atlantic westward as far as Colorado.

(2) **Ennomos magnarius** Guenée, Plate XLIV, Fig. 34, ♂
   (The Notch-wing.)
   Syn. *alniaria* Packard (non Linnaeus); *autumnaria* Moeschler (non Werneburg); *lutaria* Walker.

This is one of the larger and more conspicuous species of the family. It is rather a common insect in the northern United States,
Explanation of Plate XLIV

(The specimens figured are contained in the collection of W. J. Holland.)

1. Aicis baltearia Hulst, ♀, Type.
2. Caripeta angustioraia Walker, ♀.
5. Aicis metanemaria Hulst, ♀, Type.
7. Melanolophia canadaria Guenée, ♀.
8. Cleora atrifasciata Hulst, ♀, Type.
11. Paraphia unipuncta Haworth, ♀.
13. Lycia cognataria Guenée, ♀.
15. Nepyta nigrovenaria Packard, ♀.
17. Erannis iliaaria Harris, ♀.
18. Pterospora opuscularia Hulst, ♀, Type.
20. Euchaca californiata Packard, ♀.
22. Sieya macularia Harris, ♀.
23. Sieya macularia Harris, var., ♀.
24. Therina ferdinaria Hübner, ♀.
25. Therina fuscellaria Guenée, ♀.
27. Therina atahiasiaria Walker, ♀.
29. Epimecis virginaria Cramer, ♀.
30. Megacampa praegrandaria Guenée, ♀.
31. Eugonobapia nivosaria Guenée, ♀.
32. Plagodis emargataria Guenée, ♀.
33. Plagodis serinaria Herrich-Schaeffer, ♀.
34. Ennomos magnarius Guenée, ♀.
35. Ennomos subsignarius Hübner, ♀.
36. Plagodis keutzingi Grote, ♀.
37. Ania limbata Haworth, ♀.
38. Hyperitis amicaria Herrich-Schaeffer, ♀.
39. Xanthotype crocataria Fabricius, ♀.
40. Xanthotype calaria Hulst, ♀.
and appears on the wing most abundantly in the late summer and early fall.

**Genus XANTHOTYPE Warren**

(1) *Xanthotype crocataria* Fabricius, Plate XLIV, Fig. 39, ♂. (The Crocus Geometer.)
   Syn. *citrina* Hübner.
   Form *caelaria* Hulst, Plate XLIV, Fig. 40, ♂.
   Quite a common species in the Appalachian subregion. The insect shows great variability in the amount of the dark spots and cloudings upon the upper side of the wings.

**Genus PLAGODIS Hübner**

(1) *Plagodis serinaria* Herrich-Schaeffer, Plate XLIV, Fig. 33, ♂.
   Syn. *subprivata* Walker; *floscularia* Grote.
   A common species of the Appalachian subregion, particularly abundant among the Alleghany Mountains.

(2) *Plagodis keutzingi* Grote, Plate XLIV, Fig. 36, ♂.
   Syn. *keutzingaria* Packard.
   The habitat of this species is identical with that of the preceding.

(3) *Plagodis emargataria* Guenée, Plate XLIV, Fig. 32, ♀.
   The range of the moth is throughout the northern portions of the Atlantic subregion.

**Genus HYPERITIS Guenée**

(1) *Hyperitis amicaria* Herrich-Schaeffer, Plate XLIV, Fig. 38, ♂.
   Syn. *nyssaria* Guenée; *eximaria* Guenée; *insinuaria* Guenée; *laticincta* Walker; *subinuaria* Guenée; *neominaria* Walker; *neonaria* Packard; *asionaria* Walker.
   A very variable species, which has a wide distribution throughout the eastern portions of our territory.

**Genus ANIA Stephens**

(1) *Ania limbata* Haworth, Plate XLIV, Fig. 37, ♀.
   Syn. *vestitaria* Herrich-Schaeffer; *resitaria* Herrich-Schaeffer; *filimentaria* Guenée.
   By no means rare in the eastern portions of our territory.

349
Genus GONODONTIS Hübner

(1) Gonodontis hypochraria Herrich-Schaeffer, Plate XLV, Fig. 1, δ.
Syn. refractaria Guenee; mestusata Walker.
The insect ranges from the Atlantic coast to the central portions of the Rocky Mountains. It is very variable in color and in the distribution of the spots and markings.

(2) Gonodontis duaria Guenee, Plate XLV, Fig. 2, ♀.
Syn. kamaria Guenee; agreasaria Walker; adustaria Walker.
The distribution of this species is coincident with that of the preceding.

(3) Gonodontis obfirmaria Hübner, Plate XLV, Fig. 14, ♂.
The moth is found in the Atlantic States. It is common in western Pennsylvania.

Genus EUCHLAENA Hübner

(1) Euchlaena serrata Drury, Plate XLV, Fig. 4, ♂. (The Saw-wing.)
Syn. serrata Packard; concisaria Walker.
This rather large and showy species is not at all uncommon in the eastern portions of the region with which this book deals.

(2) Euchlaena obtusaria Hübner, Plate XLV, Fig. 3, ♂.
Syn. propriaria Walker; dextaria Walker.
Like the preceding species, a native of the eastern half of the continent.

(3) Euchlaena effectaria Walker, Plate XLV, Fig. 24, ♂.
Syn. muzaria Walker.
A denizen of the Appalachian subregion.

(4) Euchlaena amoenaria Guenée, Plate XLV, Fig. 7, ♂.
Syn. deplanaria Walker; arefactaria Grote & Robinson.
The habitat of the insect is the same as that of the preceding species.

(5) Euchlaena astylusaria Walker, Plate XLV, Fig. 8, ♂.
Syn. madusaria Walker; oponaria Walker; vinosaaria Grote & Robinson.
A native of the Atlantic States.

(6) Euchlaena pectinaria Denis & Schiffermüller, Plate XLV, Fig. 25, ♂.
Syn. deductaria Walker.
Found from the Atlantic to the Mississippi.
Genus EPIPLATYMETRA Grote

(1) Epiplatymetra coloradaria Grote & Robinson, Plate XLV, Fig. 15, ♂.
The insect is common in Wyoming and Colorado.

Genus PHERNE Hulst

(1) Pherne parallelia Packard, Plate XLV, Fig. 9, ♀.
Syn. paralleliiaria Packard.
The moth is a native of the Pacific subregion.
(2) Pherne jubararia Hulst, Plate XLV, Fig. 20, ♀.
The insect occurs in the State of Washington. The specimen depicted in the plate is the type of the species originally described by Hulst.
(3) Pherne placearia Guenée, Plate XLV, Fig. 21, ♂.
Syn. mellitularia Hulst.
The habitat of the species is California.

Genus METANEMA Guenée

(1) Metanema inatomaria Guenée, Plate XLV, Fig. 13, ♂.
A widely distributed species, found throughout the entire territory.
(2) Metanema determinata Walker, Plate XLV, Fig. 12, ♀.
Syn. carnaria Packard.
The moth occurs in the northern portions of the Appalachian subregion.
(3) Metanema quercivoraria Guenée, Plate XLV, Fig. 28, ♀.
Syn. aliaria Walker; trilinearia Packard.
The insect has a wide range in the Appalachian subregion.

Genus PRIOCYCLA Guenée

(1) Priocycla armataria Herrich-Schaeffer, Plate XLV, Fig. 6, ♂.
Very commonly found in the eastern portions of our territory.

Genus STENASPILATES Packard

(1) Stenaspilates zalissaria Walker, Plate XLV, Fig. 5, ♀.
The moth occurs in the region of the Gulf of Mexico, and is common in Florida.
Geometridæ

Genus AZELINA Guénée

(1) Azelina ancetaria Hübner, Plate XLV, Fig. 23, ♂.
Syn. hubneraria Guénée; hubnerata Packard; honestaria Walker; peplaria Hübner; stygiaria Walker; atrocolorata Hulst; morrisonata Henry Edwards.

A very common and a very variable species, which is widely distributed throughout the entire continent, except in the colder portions.

Genus SYSSAURA Hübner

(1) Syssaura infensata Guénée, Plate XLV, Fig. 10, ♀, var. biclaria Walker.
Syn. ephyrata Guénée; olyzonaria Walker; aqueus Grote & Robinson; sesquilinea Grote; amearia Walker; puber Grote & Robinson; varus Grote & Robinson; juniperaria Packard.

This species, which has a very extensive range in the southern Atlantic and Gulf States, has been frequently redescribed, as a reference to the above synonymy will show.

Genus CABERODES Guénée

(1) Caberodes confusaria Hübner, Plate XLV, Fig. 29, ♂.
Syn. remissaria Guénée; imbraria Guénée; superaria Guénée; ineusaria Guénée; floridaria Guénée; phasianaria Guénée; interlinearia Guénée; varadaria Walker; arbularia Walker; amyrisaria Walker; myandaria Walker, etc.

This is a very common moth, universally found throughout the temperate portions of the territory with which this book deals. It is somewhat variable, but there is hardly any excuse for the application to it of the multitude of names which have been given. The student is likely to recognize it in any of its slightly varying forms from the figure we have supplied in our plate.

(2) Caberodes majoraria Guénée, Plate XLV, Fig. 31, ♀.
Syn. pandaria Walker.

This is a larger species than the preceding, with more delicate wings. It ranges from the Atlantic to the Rocky Mountains.

Genus OXYDIA Guénée

(1) Oxydia vesulia Cramer, Plate XLV, Fig. 11, ♂.

This moth has a very lengthy synonymy, which we will not attempt to give. It is one of the larger species found within our territory, and ranges from Florida and Texas southward to the Valley of the Rio de la Plata in South America.
Genus TETRACIS Guenée

(1) **Tetracis crocallata** Guenée, Plate XLV, Fig. 16, ♂.
Syn. **allediitsaria** Walker; **aspilata** Guenée.
This is a common species in the Atlantic subregion.

Genus SABULODES Guenée

(1) **Sabulodes sulphurata** Packard, Plate XLV, Fig. 18, ♀.
Syn. **imitata** Henry Edwards.
A native of the Appalachian subregion.
(2) **Sabulodes arcasaria** Walker, Plate XLV, Fig. 17, ♂.
Syn. **depontanata** Grote.
The moth has the same habitat as the preceding species.
(3) **Sabulodes lorata** Grote, Plate XLV, Fig. 19, ♂.
Common in the eastern portions of our territory.
(4) **Sabulodes truxaliata** Guenée, Plate XLV, Fig. 26, ♀.
The insect ranges from Colorado to California.
(5) **Sabulodes transversata** Drury, Plate XLV, Fig. 34, ♀.
Syn. **transmutans** Walker; **contingens** Walker; **transfindens** Walker; **goniata** Guenée; **transvertens** Walker; **transposita** Walker; **incurvata** Guenée.
This is one of the commonest species which are found in the Atlantic subregion. It is very abundant in Pennsylvania in the late summer and early autumn. There is also a brood which appears in the early summer.

(6) **Sabulodes politia** Cramer, Plate XLV, Fig. 30, ♂.
The moth, which is found in Florida, and southward through the warmer portions of America, has a very extensive synonymy, which will be found in Dyar’s List.

Genus ABBOTANA Hulst

(1) **Abbotana clemataria** Abbot & Smith, Plate XLV, Fig. 32, ♀, Fig. 33, ♂, var.
Syn. **transferens** Walker; **transducens** Walker.
A somewhat variable species, which is widely distributed through the Appalachian subregion. It is not uncommon in Pennsylvania.

"Moths, which the night-air of reality blows to pieces."
CLIVE HOLLAND.—*My Japanese Wife.*

353
SUBFAMILY MECOCERATINÆ

Genus MECOCERAS Guenée

(1) Mecoceras nitocris Cramer, Plate XLV, Fig. 22, ♂.
Syn. nitocraria Hübner; peninsularia Grote.
The habitat of the species is Florida.

Genus ALMODES Guenée

(1) Almodes terraria Guenée, Plate XLV, Fig. 27, ♂.
Syn. stelligaria Guenée; squamigera Felder; balteolata Herrich-Schaeffer; assecoma Druce; calvina Druce; rivularia Grote.
This is a tropical species, the sole representative of its genus found within our borders. It ranges from Florida southward into Central and South America.

SUBFAMILY PALYADINÆ

Genus PALYAS Guenée

(1) Palyas auriferaria Hulst, Plate XLV, Fig. 36, ♂.
The specimen figured in the plate is the type which was loaned by the writer to the author of the species.

Genus PHRYGIONIS Hübner

(1) Phryigonis argenteostriata Strecker, Plate XLV, Fig. 35, ♀.
Syn. cerussata Grote; obrussata Grote.
This moth, like the preceding species, is a native of Florida.

SUBFAMILY SPHACELODINÆ

Genus SPHACELODES Guenée

(1) Sphacelodes vulneraria Hübner, Plate XLII, Fig. 20, ♂.
Syn. floridensis Holland.
The moth is found from the southern portions of North Carolina along the Atlantic coast to Florida, and ranges southward into South America.

SUBFAMILY MELANCHROIINÆ

Genus MELANCHROIA Hübner

(1) Melanchroia cephise Cramer, Plate XLII, Fig. 19, ♂.
EXPLANATION OF PLATE XLV

(The specimens figured are contained in the collection of W. J. Holland.)

1. Gonodontis hypochraria Herrich-Schaeffer, ♀.
2. Gonodontis duaria Guenée, ♂.
3. Euchlena obtusaria Hubner, ♂.
4. Euchlena serrata Drury, ♂.
5. Stenaspilates zalissaria Walker, ♀.
6. Priocycla armatoria Herrich-Schaeffer, ♀.
7. Euchlena amanaria Guenée, ♂.
10. Syssaura infensa Guenée, var. biclaria Walker, ♀.
15. Epiphatymetra coloradaria Grote & Robinson, ♂.
17. Sabulodes arcasaria Walker, ♂.
19. Sabulodes lorata Grote, ♂.
20. Pherne jubaria Hulst, ♀, Type.
23. Azelina ancetaria Hubner, ♂.
25. Euchlena pectinaria Denis & Schiffermüller, ♂.
27. Almodes terraria Guenée, ♂.
29. Caberodes conjusaria Hubner, ♂.
30. Sabulodes politia Cramer, ♂.
31. Caberodes majoraria Guenée, ♀.
32. Abbotana clemitoria Abbot & Smith, ♀.
33. Abbotana clemitoria Abbot & Smith, ♂, var.
34. Sabulodes transversata Drury, ♀.
35. Phrygionis argenteostriata Strecker, ♂.
36. Palyas auriferaria Hulst, ♂, Type.
Geometridæ

Found throughout the region of the Gulf southward to South America.

(2) **Melanchroia geometroides** Walker, Plate XLII, Fig. 18, ♂.

The moth occurs in Florida and southern Texas, and ranges thence southward into Brazil.

**SUBFAMILY BREPHINÆ**

**Genus BREPHOS** Ochsenheimer

(1) **Brephos infans** Mœschler, Plate XLII, Fig. 16, ♀. (The Infant.)

This is a boreal insect which occurs upon the White Mountains in New Hampshire, in northern Maine, and ranges thence northwardly to Labrador.

**LIVING AND DYING**

"Then let me joy to be
Alive with bird and tree,
And have no haughtier aim than this,
To be a partner in their bliss.

So shall my soul at peace
From anxious carping cease,
Fed slowly like a wholesome bud
With sap of healthy thoughts and good

That when at last I die
No praise may earth deny,
But with her living forms combine
To chant a threnody divine."

EDMUND GOSSE.—*The Farm.*
FAMILY EPILEMIDÆ

"And I will purge thy mortal grossness so,
That thou shalt like an airy spirit go.
Peaseblossom! Cobweb! Moth! and Mustardseed!"

SHAKESPEARE.—_Midsummer Night’s Dream_, III, 1.

This is a family of small moths in many respects closely allied to the _Geometridae_, so far as the structure and general appearance of the mature insects are concerned. The larvae are, however, quite different. The family has been described as follows by Hampson, "The Moths of India," Vol. III, p. 121:

"Proboscis and frenulum present. Fore wing with vein 1a separate from 1b; 1c absent; 5 from or from above the middle of the discocellulars; 7 widely separated from 8, and usually stalked with 6. Hind wing with two internal veins; vein 5 from or from above the middle of the discocellulars; 8 free from the base.

_Larvae_ with five pairs of prolegs and sparsely clothed with hair."

The family is much better represented in the tropics of the New World than in our territory, and even better represented in the tropics of the Old World than of the New. Only four genera are known to occur within the United States, _Philagrapta_, _Callia_, _Calledapteryx_, and _Schidax_. Of these we have selected one for purposes of illustration.

**Genus CALLEDAPTERYX** Grote

(1) _Calledapteryx dryopterata_ Grote, Plate XLII, Fig. 17, 5.

_Syn. erositata_ Packard.

This little moth, which may easily be distinguished by its deeply eroded or scalloped wings, is not uncommon in the Appalachian subregion. It has the habit of alighting upon old rails and the trunks of trees, and, before composing itself on its new station, of waving its wings three or four times upward and downward. This peculiar habit enables the collector to quickly recognize it.
FAMILY NOLIDÆ

"I would bee unwilling to write anything untrue, or uncertaine out of mine owne invention; and truth on every part is so deare unto me, that I will not lie to bring any man in love and admiration with God and his works, for God needeth not the lies of men."—TOPSELL, writing upon the Unicorn in The Historie of Four-footed Beasts.

This is a small family of quite small moths, which have by many authors been associated with the Lithosiidae. They are characterized by the presence of ridges and tufts of raised scales upon the fore wings. They frequent the trunks of trees, and the larvæ feed upon lichens growing upon the bark. The caterpillars have eight pairs of legs and are thinly clad with minute hairs. Four genera occur within the limits with which this book deals.

Genus CELAMA Walker

Seven species occurring within our territory are attributed to this genus.

(1) Celama triquetrina Fitch, Plate XIII, Fig. 25, ♂.  
Syn. trinotata Walker; sexmaculata Grote.

The moths may be found in the early spring of the year, sitting upon the trunks of trees in the forest. They are easily recognized by the three black tufts of raised scales upon the costa of the fore wing.

(2) Celama pustulata Walker, Plate XIII, Fig. 26, ♂.  
Syn. nigrofasciata Zeller; obaurata Morrison.

This species, like the preceding, is common in the Appalachian subregion. It may be at once distinguished from the former by the wide black band running across the middle of the primaries.

Genus NOLA Leach

There are three species of the genus found within our fauna. We select the commonest for purposes of illustration.

(1) Nola ovilla Grote, Plate XIII, Fig. 24, ♂.
Nolidae

The habits of this insect are much like those of the species described under the preceding genus. It is found associated with them at the same time and in the same localities. The moth has a considerable range in the Atlantic States, and is always very abundant in the forests of Pennsylvania in the early spring. It seems to prefer the trunks of beeches and oaks.

Genus RŒSELIA Hübner

(1) Rœselia fuscula Grote, Plate XIII, Fig. 27, ♂.
Syn. conspicua Dyar.
This moth is a native of Colorado, where it is not uncommon. An allied species, Rœselia minuscula Zeller, is found in the Atlantic States.

Genus NIGETIA Walker

(1) Nigetia formosalis Walker, Plate XIII, Fig. 32, ♂.
Syn. melanopa Zeller.
This rather pretty little creature is common in the woodlands of the Appalachian subregion. It is freely attracted to sugar, and when sugaring for moths in southern Indiana I have taken it very frequently. In fact, it appears to be commoner in southern Indiana than in any other locality where I have found it, though it is by no means rare in Pennsylvania.

"... all you restless things,
That dance and tourney in the fields of air:

... . . . . . . .
Your secret's out! I know you for the souls
Of all light loves that ever caused heartache,
Still dancing suit as some new beauty toles!
Nor can you c'er your flitting ways forsake,
Till the just winds strip off your painted stoles,
And sere leaves follow in your downward wake."

Edith M. Thomas.
"Everything lives by a law; a central balance sustains all."

C. L. von Kuebel.

This is a small family of moths peculiar to the Western Hemisphere. While the perfect insects show structural resemblances to the *Platypterygidae*, the caterpillars, which have the habit of constructing for themselves portable cases out of leaves, which they drag about with them, resemble in some respects the *Psycheidae*. The young larva of *Cicinnus melsheimeri*, immediately after hatching, draws together two small leaves with strands of silk, and makes between them its hiding-place. Afterward, when more mature, it detaches two pieces of leaves and makes out of them a case which it carries about with it, and which it can desert at will. When at rest it ties the case to a station selected with a few strands of silk, which it bites off when it desires again to start on a journey among the branches. The larva of *Lacosoma* makes a case by doubling a leaf at the midrib, cutting it off at the petiole, and taking it with it as a portable house. There are only two genera of this family in our fauna. It is more abundantly represented in the tropics of South America.

**Genus CICINNUS** Blanchard

(1) *Cicinnus melsheimeri* Harris, Plate XLI, Fig. 17, ♀.
(Melsheimer’s Sack-bearer.)
The species occurs in the eastern portions of our territory. It is not uncommon in Pennsylvania.

**Genus LACOSOMA** Grote

(1) *Lacosoma chiridota* Grote, Plate XLI, Fig. 21, ♂.
(The Scalloped Sack-bearer.)
The distribution of this species is the same as that of the foregoing. It occurs quite frequently in western Pennsylvania. Specimens from Florida in the possession of the author are smaller and much darker in color.
"The habits of insects are very mines of interesting knowledge, and it is impossible carefully to watch the proceedings of any insect, however insignificant, without feeling that no writer of fiction ever invented a drama of such absorbing interest as is acted daily before our eyes, though to indifferent spectators."

J. G. Wood.

A family of small or medium-sized moths, the larvae of which feed in a case composed of silk covered with bits of leaves, grass, twigs, or other vegetable matter, which are often arranged in a very curious manner. From this fact has arisen the custom of calling the caterpillars "basket-worms." In certain species found in Asia and Africa, these "baskets," or "cases," are spiral in form, and so closely resemble the shells of snails that they were, in fact, originally sent to the British Museum as shells by the first person who collected them. The pupa is formed within the larva-case. The males are winged, but the females are without wings. The female in almost all of the genera is possessed of a very lowly organization, being maggot-like, and in truth being little more than an ovary. She is known to deposit her eggs in the larval skin which lines the sack in which she was developed. Copulation takes place through the insertion of the abdomen of the winged male into the sack where the female is concealed. Parthenogenesis is ascertained to occur in one at least of the genera. The moths are obscurely colored. The wings of the males have numerous scales upon them, but they are in many species so loosely attached that they are lost in the first few moments of flight. In consequence the male insects appear to have diaphanous wings.

Eight genera, including the genus Solenobia, which has by most authors heretofore been reckoned among the Tineidae, are attributed by Dyar to this family as occurring within our territory. Much remains to be learned both as to the structure and the life-history of these interesting, but obscure, moths.
Psychidæ

Genus OIKETICUS Guilding

The genus is found in the hotter parts of America, the typical species having originally been found in Central America. It is also represented in southern Asia and in Australia. Three species occur in the United States—one in southern California, another in New Mexico, and a third in Florida. The latter species was named abboti by Grote, and the male is delineated in Fig. 208. The wings are pale smoky brown, with darker maculation at the end of the cell and just beyond in the primaries.

Genus THYRIDOPTERYX Stephens

(1) Thyridopteryx ephemeraeformis Haworth, Plate XLI, Fig. 12, 5.

Syn. coniferarum Packard.

The common “Bag-worm,” as it is usually called, occurs throughout the Appalachian subregion, from the Atlantic to the borders of the Great Plains. It is a very promiscuous feeder, attacking trees and shrubs of many genera, but, so far as is
Psychidae

known, abstaining from the Gramineae. It evinces special fondness for the conifers, and above all for the red cedar and arborvitae. It has proved very injurious to shade-trees in some of our cities, and its ravages in St. Louis and Washington have been made the subject of repeated comment in the literature of economic entomology. A very full and interesting account of the habits of this peculiar insect was published by the late Professo; C. V. Riley in the "First Annual Report of the State Entomologist of Missouri," to which the reader will do well to refer. The "bag," or "basket," of the male insect is smaller than that of the female. The males escape from the lower end of the case in the winged form, and having copulated with the females, which remain in their cases and are apterous and sluggish, die. The female deposits her eggs, which are soft and yellow, in the sack where she has her home, and ends her existence by leaving what little of her body remains after the ova have been extruded, as a sort of loose plug of desiccated tissue at the lower end of the sack. The eggs remain in the case till the following spring, when they hatch. The young larvae emerge, and placing themselves upon the leaves, where they walk about on their fore feet, with their anal extremities held up perpendicularly, proceed to construct about themselves little cones of vegetable matter mixed with fine silk. After a while they cease to hold these cones erect, and seizing the leaves and branches with their feet, allow the bag to assume a pendant position. They moult within their cases four times before reaching maturity and pupating.

The remedy for these insects is to simply collect the cases which may be found in the fall and winter hanging from the branches, and burn them. In one of the parks in St. Louis several years ago, the superintendant caused the cases to be collected, and they were destroyed by the bushel, with great benefit to the trees the next summer.

Genus EURCYTTARUS Hampson

This is a small genus of very small case-bearing moths, two species of which are known to occur in the United States. E. carbonaria is found in Texas. The other species, which we figure, is a native of the Appalachian subregion.
(1) *Eurycyttarus confederata* Grote & Robinson, Plate I, Fig. 16, larval case; Plate XLI, Fig. 8, $\ddagger$.

The insects feed upon grasses and herbaceous plants in the larval state. When ready to pupate they attach their cases to the under side of rails, the stringers of fences, and fallen branches of trees. The insect is very common in western Pennsylvania and in the city of Pittsburgh.

**FAR OUT AT SEA**

"Far out at sea—the sun was high,
While veered the wind and flapped the sail;
We saw a snow-white butterfly
Dancing before the fitful gale
Far out at sea.

The little wanderer, who had lost
His way, of danger nothing knew;
Settled a while upon the mast;
Then fluttered o'er the waters blue
Far out at sea.

Above, there gleamed the boundless sky;
Beneath, the boundless ocean sheen;
Between them danced the butterfly,
The spirit-life of this vast scene,
Far out at sea.

The tiny soul that soared away,
Seeking the clouds on fragile wings,
Lured by the brighter, purer ray
Which hope's ecstatic morning brings—
Far out at sea.

Away he sped, with shimmering glee,
Scarce seen, now lost, yet onward borne!
Night comes with wind and rain, and he
No more will dance before the morn,
Far out at sea.

He dies, unlike his mates, I ween
Perhaps not sooner or worse crossed;
And he hath felt and known and seen
A larger life and hope, though lost
Far out at sea."

R. H. Horne.—*Genius.*

363
FAMILY COCHLIDIIDÆ

"The rearing of larvae . . . when joined with the entomological collection, adds immense interest to Saturday afternoon rambles, and forms an admirable introduction to the study of physiology."  

HERBERT SPENCER, in *Education.*

This family, which has generally been known as the *Limacodidae,* is described as follows by Hampson, "The Moths of India," Vol. I, p. 371:

"Fore wing with two internal veins; vein 1b forked at the base. Hind wing with vein 8 arising free, then bent down and usually anastomosing shortly with 7 near the base of the cells; three internal veins.

*Larva* limaciform, and either bearing series of spinous stinging tubercles, or smooth and segmented, or unsegmented with very thick transparent cuticle; the head, legs, and claspers small and often retractile.

*Cocoon* hard and compact; round or oval in shape, with a lid for the escape of the imago prepared by the larva."

These curious insects, the larvæ of which are commonly known as "slug-caterpillars," are better represented in the tropics of both hemispheres than in the more temperate regions. Nevertheless our fauna contains quite a large number of genera and species. Of the majority of these we give illustrations.

**Genus SIBINE Herrich-Schaeffer**

(1) *Sibine stimulea* Clemens, Plate I, Fig. 6, larva; Plate XLVII, Fig. 9, ♂. (The Saddle-back.)

Syn. *ephippiatus* Harris.

The green caterpillars with their little brown saddle on the back are familiar to every Southern boy who has wandered in the corn-fields, and many a lad can recall the first time he came in contact with the stinging bristles as he happened to brush against the beastie. Nettles are not to be compared in stinging power to the armament of this beautifully colored larva.

364
Genus EUCLEA Hübner

(1) Euclea nanina Dyar, Plate XLVII, Fig. 25, ♂ .
Syn. nana Dyar (non Herrich-Schaeffer).
The moth is a native of Florida. The writer took it in some numbers, in the spring of the year 1884, on the upper waters of the St. Johns.

(2) Euclea delphinii Boisduval, Plate XLVII, Fig. 24, ♀ .
(The Spiny Oak-slug.)
Syn. strigata Boisduval; quercicola Herrich-Schaeffer; tardigrada Clemens; ferruginea Packard; argentatus Wetherby.
Form viridiclava Walker, Plate XLVII, Fig. 23, ♂ .
Syn. monitor Packard.
Form pænulata Clemens, Plate XLVII, Fig. 5, ♂ .
This is a very variable species. It occurs in the eastern portion of our territory, and is not at all uncommon.

(3) Euclea indetermina Boisduval, Plate XLVII, Fig. 10, ♂ .
Syn. vernata Packard.
The species is found in the States of the Atlantic seaboard.

(4) Euclea chloris Herrich-Schaeffer, Plate XLVII, Figs. 15 and 29, ♀ , Fig. 26, ♂ .
Syn. viridis Reakirt; fratema Grote.
The insect has the same range as the species last mentioned.

Genus MONOLEUCA Grote & Robinson

The insects belonging to this genus are subtropical so far as they are known to occur in the United States. The genus is well represented in Central and South America.

(1) Monoleuca semifascia Walker, Plate XLVII, Fig. 22, ♂ .
The moth is found in the Gulf States.

Genus ADONETA Clemens

(1) Adoneta spinuloides Herrich-Schaeffer, Plate XLVII, Fig. 3, ♂ .
Syn. voluta Clemens; ferrigera Walker; nebulosus Wetherby.
This is a common species in western Pennsylvania, and is widely distributed through the Appalachian subregion.

(2) Adoneta pygmaea Grote & Robinson, Plate XLVII, Fig 19, ♂ . (The Pygmy Slug.)
The moth has thus far been found only in Texas.

365
Cochlidiidae

Genus SISYROSEA Grote

(1) Sisyrosea textula Herrich-Schaeffer, Plate XLVII, Fig. 14, ♂.
  Syn. inornata Grote & Robinson.
  The insect occurs in the eastern portion of our territory. It is not rare about Pittsburgh.

Genus NATADA Walker

(1) Natada nasoni Grote, Plate XLVII, Fig. 13, ♀. (Nason’s Slug.)
  Syn. daona Druce; rude Henry Edwards.
  The moth ranges from the southern portions of the Atlantic coast westward and southward to Texas and Mexico.

Genus PHOBETRON Hübner

(1) Phobetron pithecium Abbot & Smith, Plate I, Fig. 14, larva; Plate XLVII, Fig. 6, ♂, Fig. 7, ♀. (The Monkey Slug.)
  Syn. abbotana Hübner; nigricans Packard; hyalinus Walsh; tetradactylus Walsh; nondescriptus Wetherby.
  The perfect insects are quite dissimilar in the two sexes. The larva, which is a very curious object, feeds upon the Rosacea, the Cupuliferæ, and various low-growing shrubs, as the sassafras, alder, and Spiræ. The species is found in the Appalachian sub-region, and was quite common in western North Carolina in former years, and may be so still. The larvæ are generally to be found close to the ground.

Genus ISOCHÆTES Dyar

(1) Isochætes beutenmülleri Henry Edwards, Plate XLVII, Fig. 17, ♀.
  This is a rare little insect, which has practically the same distribution as the preceding species.

Genus ALARODIA Mœschler

(1) Alarodia slossoniiæ Packard, Plate XLVII, Fig. 18, ♀. (Slosson’s Slug.)
  This remarkable little species inhabits in the larval stage the mangroves which grow in the swampy lands on the southern coast of Florida. A good account of its habits has been pub
lished by Dr. Dyar in the "Journal of the New York Entomological Society," Vol. V, and indeed the student who desires to know about the habits of this and all other species of the Cochliidiidae found in North America must consult the writings of this author, who has made these insects the subject of special and exhaustive inquiry.

**Genus PROLIMACODES**

(1) *Prolimacodes scapha* Harris, Plate I, Fig. 9, larva; Plate XLVII, Fig. 8, ♀. (The Skiff Moth.)

The moth has a wide distribution throughout the Appalachian subregion. The larva feeds upon a great variety of shrubs and trees. It appeared to me in my boyhood, when I reared it often, to have a particular fondness for the leaves of the sycamore (*Platanus*).

**Genus COCHLIDION** Hübner

(1) *Cochlidion biguttata* Packard, Plate XLVII, Fig. 4, ♀.

A native of the eastern portions of the region.

(2) *Cochlidion rectilinea* Grote & Robinson, Plate XLVII, Fig. 27, ♂.

The insect is quite common locally, and has the same distribution as the preceding species.

(3) *Cochlidion y-inversa* Packard, Plate XLVII, Fig. 21, ♂.

The distribution of the species is the same as that of the two preceding. The larva frequents hickory.

**Genus LITHACODES** Packard

(1) *Lithacodes fasciola* Herrich-Schaeffer, Plate XLVII, Fig. 2, ♂.

The caterpillar feeds on a great variety of low shrubs and trees; it is especially fond of the leaves of the various species of wild cherry. It is common in western Pennsylvania, and is well distributed throughout the Appalachian subregion.

**Genus PACKARDIA** Grote & Robinson

(1) *Packardia elegans* Packard, Plate XLVII, Fig. 16, ♀.

Syn. *nigripunctata* Goodell.
Megalopygidae

The larvae feed upon a great variety of trees and shrubs, and are commonly found in the deep glens and ravines of the Appalachian subregion, where there is much shade and moisture. The insect is not uncommon in the vicinity of Pittsburgh.

(2) Packardia geminata Packard, Plate XLVII, Fig. 1, ♂.

The larvae frequent places exactly opposite in character to those resorted to by the previous species, being fond of dry open woods, and living upon low shrubs and bushes. The insect is a native of the Appalachian subregion.

Genus HETEROGENEA Knoch

(1) Heterogenea shurtleffi Packard, Plate XLVII, Fig. 20, ♂.

This, which is one of the very smallest of all the Cochliidiidae, feeds in its larval stage upon black oak, chestnut, beech, and ironwood. The genus is found both in the Old World and the New.

Genus TORTRICIDIA Packard

(1) Tortricidia flexuosa Grote, form caesonia Grote, Plate XLVII, Fig. 12, ♀.

A native of the Appalachian subregion, the larva feeding on chestnut, oak, hickory, and wild cherry. It is not uncommon in western Pennsylvania.

(2) Tortricidia testacea Packard, Plate I, Fig. 19, larva; Plate XLVII, Fig. 11, ♂.

The insect, which has the same habitat as the preceding species, feeds upon the same species of plants. It is not uncommon at light in western Pennsylvania.

FAMILY MEGALOPYGIDÆ

“Simple and sweet is their food: they eat no flesh of the living.”

C. L. von Kuebel.

This is a small family characteristic of the neotropical regions, and represented by three or four genera, which have a foothold in the southern portions of our territory.

Genus CARAMA Walker

(1) Carama cretata Grote, Plate XXXVIII, Fig. 22, ♂.

Syn. pura Butler.
Dalceridae

The insect feeds in its larval stage upon the red-bud (Cercis). The caterpillars are gregarious at first, but during the later part of their life separate. The cocoon is made in the ground. The insect occurs from New Jersey and southern Pennsylvania southward in the Appalachian region at comparatively low elevations.

Genus MEGALOPYGE Hübner

(1) Megalopyge opercularis Abbot & Smith, Plate XXXVIII, Fig. 25, ♂.

Syn. lanuginosa Clemens; subcitrina Walker.

The moth is found in Georgia and the region of the Gulf States.

Genus LAGOA Harris

(1) Lagoa crispata Packard, Plate XXXVIII, Fig. 23, ♂. (The White Flannel-moth.)

The caterpillar feeds upon the flowering blackberry (Rubus villosus), and ranges from Massachusetts southward along the coast.

(2) Lagoa pyxidifera Abbot & Smith, Plate XXXVIII, Fig. 24, ♂. (The Yellow Flannel-moth.)

This is a rare moth in collections. It is no doubt common enough in its proper locality, but thus far few collectors have succeeded in finding it. Its home is on the seaboard of the Southern States.

FAMILY DALCERIDÆ

"So man, the moth, is not afraid, it seems,
To span Omnipotence, and measure night
That knows no measure, by the scanty rule
And standard of his own, that is to-day,
And is not ere to-morrow's sun go down."

Cowper.—*The Task*, VI, 211.

This is another family which is represented in our fauna only by a small number of species. Besides the insect known as Dalcerides ingenita Henry Edwards, there is only one other species referable to the family known to occur within the United States. This insect is Pinconia coa Schaus, a moth which is not uncommon in Mexico, and occurs in Arizona as a straggler into our territory. Dalcerides ingenita is likewise an inhabitant
of Arizona. In Central and South America the Dalceridae are more numerously found. Of Pinconia coa we give a representation on Plate VIII, Fig. 6.

**FAMILY EPIPYROPIDÆ**

"So, naturalists observe, a flea
Has smaller fleas that on him prey;
And these have smaller still to bite 'em,
And so proceed ad infinitum."

*Swift. — A Rhapsody.*

The *Epipyropidae* are a very remarkable little family of parasitic moths, of which, as yet, comparatively little is known. Professor J. O. Westwood of Oxford, in the year 1876, published an account of a lepidopterous insect, the larva of which lived upon *Fulgora candelaria*, the great tree-hopper, which is abundant at Hong-Kong and elsewhere in southeastern Asia. The caterpillar, according to Westwood, feeds upon the white, cottony secretion, which is found at the base of the wings of *Fulgora*. In 1902 Dr. Dyar described another species, the moth of which was bred from a larva which was found attached to the body of a tree-hopper belonging to the genus *Issus*. The specimen came from New Mexico, and was taken at Las Vegas Hot Springs. The moth, cocoon, and an alcoholic specimen of the larva are preserved in the United States National Museum. Mr. Champion, the veteran explorer of Central America, who has done so much to instruct us as to the biology of those lands, has recorded in a note in the Proceedings of the Entomological Society of London for 1883, p. xx, that a similar phenomenon was observed by him while collecting in Central America. There is here a field of interesting study for some patient observer whose home is in New Mexico. Dr. Dyar named the New Mexican insect *Epipyrops barberiana*.

"The little fleas that do so tease,
Have smaller fleas that bite 'em,
And these again have lesser fleas,
And so ad infinitum."

*Swift. As popularly but incorrectly quoted.*
FAMILY ZYGAENIDÆ

"Every traveller is a self-taught entomologist."

Oliver Wendell Holmes.—The Autocrat of the Breakfast-table.

The Zygaenidæ are not very well represented in the fauna of North America. They are more numerous in the Old World than in the New, and the genera found in the New World are mainly aberrant. The family has been characterized as follows by Hampson, "Moths of India," Vol. I, p. 228: "Closely allied to the Syntomideræ, but distinguished by vein 1a of the fore wing being present, except in Anomoeotes; vein 8 of the hind wing present and connected with 7 by a bar; veinlets in the cell of both, with wings generally present. Frenulum present except in Himantopterus."

Larva short and cylindrical.
Pupa in a silken cocoon."

Genus ACOLOITHUS Clemens

(1) Acoloithus falsarius Clemens, Plate XVI, Fig. 14, 6.

Syn. sanborni Packard.
The larva feeds upon the grape and the Virginia creeper (Ampelopsis). The insect is not scarce in the Atlantic States.

Genus PYROMORPHA Herrich-Schaeffer

(1) Pyromorpha dimidiata Herrich-Schaeffer, Plate XLVII, Fig. 33, 6.

Syn. perlucidula Clemens.
The insect is not very common. It is a native of the eastern portions of the territory with which this book deals.

Genus TRIPROCRIS Grote

There are eight species assigned to this genus in recent lists. They are all found in the south-western portions of our territory.

(1) Triprocris rata Henry Edwards, Plate XIII, Fig. 4, 6.

A native of Arizona.

1 Genera found in Asia and Africa.
Zygaenidae

(2) **Triprocris latercula** Henry Edwards, Plate XIII, Fig. 5, ♂.
Has the same habitat as the preceding species.

(3) **Triprocris constans** Henry Edwards, Plate XIII, Fig. 16, ♂.
The moth occurs in New Mexico.

(4) **Triprocris smithsonianus** Clemens, Plate XLVII, Fig. 32, ♂.
The insect is not uncommon in the southern portions of Colorado, and is found in New Mexico and northern Texas.

**Genus HARRISINA** Packard

Three species belonging to the genus occur within the United States. Two of these are indigenous to Texas and Arizona. The other has a wide range through the Appalachian subregion. We have selected it for illustration.

(1) **Harrisina americana** Guérin-Méneville, Plate XLVII, Fig. 34, ♂.
Syn. texana Stretch.
The habits of this insect have been so well described by Professor C. V. Riley that we cannot do better than quote some passages from his account, which is to be found in the "Second Annual Report of the State Entomologist of Missouri," at page 85. He says: "During the months of July and August, the leaves of the grape-vine may often be found denuded of their softer parts, with nothing but the veins, and sometimes only a few of the larger ribs left skeleton-like, to tell the mischief that has been done. Very frequently only portions of the leaf will be thus denuded, and in that event, if we examine such a leaf closely, we shall find the authors of the mischief drawn up in line upon the yet leafy tissue with their heads all toward the margin, cutting away with their little jaws and retreating as they feed."

372
These soldier-like files are formed by worms in black and yellow uniforms which produce a moth popularly known as the American Procris. The eggs from which they hatch are laid in small clusters on the underside of the leaves, and while the worms are small, they leave untouched the most delicate veins of the leaf, which then presents the appearance of a fine network, as shown in the right of the figure (211); but when they become older and stronger they devour all but the larger ribs, as shown at the left of the figure. When full grown these worms disperse over the vines or forsake them entirely, and each spins for itself a small, tough, whitish, flattened cocoon, within which, in about three days, it changes to a chrysalis, three tenths of an inch long, broad, flattened, and of a light shining yellowish-brown color. In about ten days afterwards the moths begin to issue."

The insect is double-brooded. It is common in the Appalachian subregion, ranging from the Atlantic to the borders of the Great Plains in the West.

**FAMILY CHALCOSIIDÆ**

"Daughters of the air."—De La Fontaine.

This family is represented in our fauna by but a single insect, belonging to the genus *Gingla*, established by Walker. It is an obscure little moth known as *Gingla latercula* Dyar. Its habitat is Arizona.

373
FAMILY THYRIDIDÆ

"And yet I will exercise your promised patience by saying a little of the Caterpillar, or the Palmer-fly or worm, that by them you may guess what a work it were in a discourse but to run over those very many flies, worms, and little living creatures with which the sun and summer adorn and beautify the river-banks and meadows, both for the recreation and contemplation of us Anglers: pleasures which, I think, myself enjoy more than any other man that is not of my profession."

IZAAK WALTON.—The Compleat Angler, Chap. V, Pt. 1

The Thyrididae are a small family of moths revealing decided affinity to the Pyralidae. They have been characterized as follows by Hampson, "Moths of India," Vol. I, p. 352: "Moths generally with hyaline patches and striæ on the wings. Palpi obliquely upturned and slender. Antennæ almost simple. Fore wing with vein 1α forming a fork with 1b at base; 1c absent; 5 from near lower angle of cell. Hind wing with two internal veins; vein 8 nearly touching vein 7 just before or after the end of the cell. Mid tibia with one pair of spurs; hind tibia with two pairs.

Larva pyraliform, with five pairs of legs."

Six genera are attributed to this family in the last list of the species found within the United States which has been published. Of four of these we give illustrations.

Genus THYRIS Laspeyres

(1) Thyris maculata Harris, Plate XLVII, Fig. 30, ♀.
(2) Thyris lugubris Boisduval, Plate XLVII, Fig. 31, ♂.

Genus DYSODIA Clemens

(1) Dysodia oculatana Clemens, Plate III, Fig. 10, ♀. (The Eyed Dysodia.)
Cossidae

Syn. *plena* Walker; *fasciata* Grote & Robinson; *montana* Henry Edwards; *aurea* Pagenstecher.

The species is widely distributed throughout the entire United States. It is very common in western Pennsylvania.

Genus HEXERIS Grote

(1) *Hexeris enhydris* Grote, Plate XLVII, Fig. 35, ♂.

Syn. *reticulum* Beutenmüller.

The moth occurs in the subregion of the Gulf.

Genus MESKEA Grote

(1) *Meskea dyspteraria* Grote, Plate XLVII, Fig. 36, ♂.

The moth is found in Florida and the region of the Antilles.

FAMILY COSSIDÆ

"Bright insect, ere thy filmy wing,
Expanding on the breath of spring,
Quivered with brief enjoyment,
’T was thine for years immured to dwell
Within a lone and gloomy cell,
To eat,—thy sole employment."

—*Acheta Domestica*.

The Cossidae, "Goat-moths," or "Carpenter-worms," as they are familiarly called, have sorely puzzled systematists. Some writers have been inclined to regard them as allied to the Tortricidae. We assign them the position in the linear series which is accorded them by Hampson and also by Dyar. They form a very distinctly defined group, whatever their relationships may be. They are succinctly described by Hampson in "The Moths of India," Vol. I, p. 304, as follows: "Proboscis absent; palpi usually minute or absent; antennae bipectinated to tip or with distal half simple in both sexes, or wholly simple in female. Tibiae with spurs absent or minute. Fore wing with vein 1b forked at base; 1c present; an areole formed by veins 7 and 10; veins 7 and 8 forking after the areole; the inner margins usually more or less lobed. Hind wing with three internal veins; vein 8 free from the base or connected with 7 by an erect bar at end of cell. Both wings with forked veinlets in cell. The female may have as many as nine bristles to the frenulum.

375
Cossidæ

*Larva.* Smooth, with a few hairs; internal feeders, boring galleries in wood or the pith of reeds, etc., and often doing considerable damage.

*Pupa* in a cocoon formed of silk and chips of wood.”

Six genera are recognized as occurring within our fauna.

**Genus ZEÚZERA Latreille**

(1) *Zeuzera pyrina* Linnaeus, Plate IX, Fig. 9, δ. (The Leopard-moth.)

Syn. *hypocastrina* Poda; *esculii* Linnaeus; *hilaris* Fourcroy; *decipiens* Kirby.

This insect is a native of the Old World, but has within recent years become introduced and acclimated on Long Island, and has multiplied to a great extent in the environs of the city of Brooklyn. It has already inflicted much damage upon trees, and, apparently being firmly established, is destined to work still greater injury. It is a promiscuous feeder, but evinces a particular fondness for elms and maples.
Cossidae

The eggs are generally laid near the crotch of the tree, and watch should be kept in the spring of the year to detect their presence and destroy them before they are hatched.

Genus COSSUS Fabricius

The genus is found on both sides of the Atlantic. *Cossus cossus* Linnaeus is a large species which does great damage to trees in Europe. As I am writing, my friend, Dr. Ortmann, relates that when he was a boy of eleven, living in his native village in Thuringia, his attention was called to a notice posted by the Bürgermeister offering a reward for information which would lead to the detection and punishment of the individuals who by boring into the trunks of a certain fine avenue of birch-trees, upon which the place prided itself, had caused great injury to them. Already the instincts of the naturalist had asserted themselves, and the prying eyes of the lad had found out the cause of the trouble. He went accordingly to the office of the Bürgermeister and informed him that he could tell him all about the injury to the trees. The official sat wide-mouthed and eager to hear. “But you must assure me, before I tell you, that the reward you offer will surely be paid to me.” “Yes, yes, my little man; do not be in doubt on that score. You shall certainly be paid.” “Well, then, Herr Bürgermeister, the holes from which the sap is flowing were not made by boys who were after the birch-sap to make beer, but by the *Weidenbohrer.*”¹ A small explosion of official dignity followed. The act of the presumptuous boy was reported to a stern parent, and the result was, in Yankee phrase, a “licking,” which was certainly undeserved.

1. *Cossus centerensis* Lintner, Plate XII, Fig. 1, ♂.
   The insect is quite rare. It is found in the Atlantic States.

2. *Cossus undosus* Lintner, Plate XLI, Fig. 9, ♀.
   Syn. *brucei* French.
   The moth occurs in the region of the Rocky Mountains. The specimen figured was taken on the Arkansas River in Colorado, near Canyon City.
   It is undoubtedly the most attractively marked and most elegant species found in our territory.

¹The common German name for the *Cossus.*

377
Genus PRIONOXYSTUS Grote

There are two species of this genus found in the United States. One of them, Prionoxystus macmurtrei Guérin-Méneville = querciperda Fitch, is a rather rare species. It bores its larval passages in oak. The female, which resembles the female of the other species, is quite large, sometimes four inches in expanse of wing. The male, on the other hand, is quite diminutive. I have never seen a male much more than an inch and a half in expanse of wing. The species has been taken most frequently in recent years in western Pennsylvania by local collectors. The other species, Prionoxystus robiniae Peck, is very common. It frequents various trees, but shows a preference for the wood of the common locust (Robinia pseudacacia) and various species of the genus Populus. The male is depicted on Plate XLI, Fig. 11, and the female by Fig. 10 on the same plate. The insect is widely distributed throughout the United States. I have found the males exceedingly abundant about the electric lights in some of our Western cities, as St. Paul and Omaha.

Genus INGUROMORPHA Henry Edwards

Two species of this genus occur within our limits. Both are found in the extreme southern portions of the United States. I. arbeloides Dyar is a native of Arizona. I. basalis Walker, which is shown in the annexed figure, is found in Florida and Mexico.

The general color of the fore wings is pale ashen-gray, with the outer border dull ochreous, marked with dark-brown striae, and broader spots and blotches toward the outer margin. The hind wings are darker gray.

"I recognize
The moths, with that great overpoise of wings
Which makes a mystery of them how at all
They can stop flying."

E. B. Browning. — Aurora Leigh.

378
Genus COSSULA Bailey

Only one species of this genus is known from our fauna. It occurs in Florida and Mexico. It was named magnifica by Strecker, and subsequently also by Bailey. Druce in the year 1891 applied to it the specific name norax. It is represented in the annexed cut one third larger than the size of life. It is as yet a rare insect in collections, only a few specimens having been found. No doubt it is locally common, and when some shrewd observer discovers its haunts and mode of life, we shall all have a good supply of specimens in our cabinets.

Genus HYPOPTA Hübner

Nine species are said to belong to this genus and are reputed to occur within our territory. They are all Southern or Southwestern forms.

(1) Hypopta bertholdi Grote, Plate XII, Fig. 2, ♀. The specimen figured on the plate came from California. The author has also received it from Colorado.

(2) Hypopta henrici Grote, Plate XII, Fig. 3, ♂. The moth is found in Arizona and New Mexico.

FAMILY ÆGERIIDÆ

"I'll follow you, I'll lead you about a round
Through bog, through bush, through brake, through briar."

SHAKESPEARE. —Midsummer Night's Dream, III, 1.

The name Sesia being, according to the laws of priority, strictly applicable to a genus of the Sphingidae, as has been pointed out on page 61, the name of the family which we are now considering must be that which is given above. The name "Sesiidae" must yield to the name "Ægeridae." This is on some accounts regrettable, as the former name has for many years been consistently applied to the family by many authors.
The name which we use has also been applied by a multitude of writers, and is already well established in use in certain quarters.

The *Aegeriidae* are diurnal in their habits, flying in the hottest sunshine. They are very rapid on the wing. Their larvae are borers, feeding on the inner bark or the pith of trees and lesser plants. The pupae are generally armed with hook-like projections, which enable them to progress in a forward direction in the galleries in which they are formed. Some of the genera have at the cephalic end a sharp cutting projection, which is used to enable the insect to cut its way out of the chamber before the change into a moth takes place. The moths have been described as follows by Hampson in "The Moths of India," Vol. I, p. 189: "Antennæ often dilated or knobbled. Legs often with thick tufts of hair; mid tibiae with one pair of spurs; hind tibiae with two pairs. Frenulum present. Wings generally more or less hyaline; fore wing with veins 1a and 1b forming a fork at base; 1c absent; veins 4 to 11 given off at almost even distances from the cell. Hind wing with three internal veins; vein 8 coincident with 7."

The American species have been very thoroughly monographed by Mr. Beutenmüller, the amiable and accomplished Curator of the Section of Entomology in the American Museum of Natural History in New York. It is through his kindness that the author is able to give on Plate XLVI of the present volume so many illustrations of the species which are found in our fauna. The student who desires to know more about these things must consult Mr. Beutenmüller's great work.

**Genus MELITTIA Hübner**

(1) *Melittia satyriniformis* Hübner, Plate XLVI, Fig. 1, ♀.

*Syn. cucurbita* Harris; *ceto* Westwood; *amena* Henry Edwards.

The larva of the insect is commonly known as the "Squash-borer," or the "Pumpkin-borer." The insect has an extensive range from New England to the Argentine States. It attacks the Cucurbitaceae generally, laying the eggs upon all parts of the plant, but preferably upon the stems, into which the caterpillar bores, and in which it develops until the time of pupation, when it descends into the ground, makes a cell beneath the surface in
which it hibernates, and is transformed into a chrysalis the following spring. The moths emerge, according to locality, from June to August. It is said to be double-brooded in the southern parts of our region, but is single-brooded in the Northern States.

(2) *Melittia snowi* Henry Edwards, Plate XLVI, Fig. 2, $\delta$.
This species is very closely allied to the preceding, but the fore wings are devoid of the metallic tints which appear in that species, and there are other minor differences which present themselves upon comparison of the two forms. The life-history remains to be worked out. It is thus far known only from Kansas.

(3) *Melittia grandis* Strecker, Plate XLVI, Fig. 3, $\varphi$.
The insect is reported to occur in Texas and Arizona.

**Genus GÆA Beutenmüller**

(1) *Gæa emphytiformis* Walker, Plate XLVI, Fig. 5, $\varphi$.
The types of this species are found in the British Museum. Nothing is known definitely as to its true locality, except that the specimens came from the United States. Of course the life-history is also unknown. It is to be hoped that some reader of this book will rediscover the species and let us all know its true history.

(2) *Gæa solituda* Henry Edwards, Plate XLVI, Fig. 4, $\delta$.
The species occurs in Kansas and in Texas, but the history of its mode of development from egg to imago remains to be written.

**Genus EUHAGENA Henry Edwards**

There is only one species of this genus known at the present time. It was named *nebraskæ* by Henry Edwards in the year 1881. A male specimen is depicted on Plate XLVI, Fig. 34. The species may easily be recognized by its red wings. Its early history is unknown. I received several specimens of the insect some time ago from a friend who sent them to me, but so wretchedly packed that nothing came to hand but fragments. The well-meaning sender had done them up in cotton as if they were birds' eggs, and of course they were all smashed. Never wrap cotton about moths or butterflies, and then ram cotton down into the box to make the specimens ride well. Particularly avoid the "ramming" process.
Genus ALCOTHOE Henry Edwards

(1) Alcothoe caudata Harris, Plate XLVI, Fig. 6, ♂.
The larvæ bore in the roots of various species of clematis. The insect is widely distributed, occurring from Canada to Florida, and westward to the Mississippi. The moths come out in April and May in the South, and from June to August in the North. The larvæ hibernate in their galleries in various stages of growth.

Genus SANNINA Walker

(1) Sannina uroceriformis Walker, Plate XLVI, Fig. 7, ♂.
Syn. quinquecaudatus Ridings.
The larva feeds on the tap-root of the persimmon (*Diospyros*) at a depth of from eighteen to twenty-two inches under the ground. The species occurs from Virginia to Florida, and westward as far as the food-plant ranges.

Genus PODOSESIA Mœschler

(1) Podosesia syringæ Harris, Plate XLVI, Fig. 17, ♀.
Syn. longipes Mœschler.
The larvæ feed on the ash and the lilac. They tunnel their passages straight into the wood for many inches. They cut their way out almost to the surface just before pupating, leaving only a thin layer of fiber to close the end of the gallery; this is broken through by the emergent pupa as it comes forth from its cocoon, and then the pupal envelope is split and the perfect winged insect appears. The moths are on the wing in western Pennsylvania in June, and are to be found on the blossoms of *Syringa*.

Genus MEMYTHRUS Newman

(1) Memythrus tricinctus Harris, Plate XLVI, Fig. 14, ♀.
The larvæ infest the small trunks of willows and poplars. The moths appear in the latter part of June and the beginning of July; the caterpillars hibernate in their galleries. Transformation occurs in a tough cocoon located at the outer end of the gallery. The species is found in New England and the Middle States, ranging westward as far as Ohio and Michigan.

(2) Memythrus polistiformis Harris, Plate XLVI, Fig. 11, ♂, Fig. 12, ♀.

382
Explanation of Plate XLVI

(The figures in this plate are taken by the kind permission of Mr. William Beutenmuller from the plates illustrating his Monograph of the Sesiidæ of North America.)

1. Melittia satyriniformis Hübner, ♀.
3. Melittia grandis Streecker, ♀.
5. Gca emphytiiformis Walker, ♀.
6. Alcatheca caudata Harris, ♂.
7. Sannina urocerriformis Walker, ♂.
8. Ageria apiiformis Linnaeus, ♀.
9. Bembecia marginata Harris, ♀.
10. Memythrus simulans Grote, ♀.
11. Memythrus polistiformis Harris, ♂.
12. Memythrus polistiformis Harris, ♀.
14. Memythrus tricinctus Harris, ♀.
17. Podosesia syringa Harris, ♀.
25. Synanthedon pyri Harris, ♀.
27. Synanthedon albicornis Henry Edwards, ♀.
28. Synanthedon acerni Clemens, ♀.
29. Synanthedon scitula Harris, ♀.
32. Synanthedon rutilans Henry Edwards, ♀.
34. Euhagena nebraskae Henry Edwards, ♂.
35. Parantherene heuchera Henry Edwards, ♂.
36. Calasesia coccinea Beutenmüller, ♀.
37. Albuna pyramidalis, var. montana Henry Edwards, ♂.
The insect, which is popularly known as the "Grape-root Borer," ranges from Vermont to the Carolinas, and westward as far as Missouri. It inflicts considerable damage upon both wild and cultivated grape-vines. The moth resembles the wasps of the genus Polistes, whence the name.

(3) Memythus simulans Grote, Plate XLVI, Fig. 10, ♀.

The insect, which is known to occur from New England to Minnesota, not ranging below the Potomac and the Ohio, feeds in its larval stage upon the wood of the red oak.

(4) Memythus admirandus Henry Edwards, Plate XLVI, Fig. 13, ♂.

The habitat of the species is Texas.

Genus PALMIA Beutenmüller

(1) Palmia præcedens Henry Edwards, Plate XLVI, Fig. 15, ♀.

The moth is known to occur in North Carolina. It is very rare in collections as yet, and nothing is known of its life-history.

Genus ÆGERIA Fabricius

(1) Ægeria apiformis Clerck, Plate XLVI, Fig. 8, ♀.

Syn. vestiformis Hufnagel; crabroniformis Denis & Schiffermüller.

This insect, which in England is known as the "Hornet-moth," because of its resemblance to a hornet, is found abundantly in Europe, but less commonly in North America. Its larva lives in the roots and lower portions of the trunks of poplars and willows, and requires two years in which to undergo transformation.

Genus BEMBECIA Hübner

(1) Bembecia marginata Harris, Plate XLVI, Fig. 9, ♀.

Syn. pleciaformis Walker; adynertennis Walker; rubi Riley; flavipes Hulst.

The insect, which is popularly known as the "Blackberry-borer," is not at all uncommon. The grub-like larvae infest the roots of blackberries and raspberries, and when mature eat their way up about three inches through the pith of the dead cane, and cutting their way outwardly, leave only a thin layer of the epidermis between themselves and the outer air. The pupa is armed at its head with a triangular chisel-shaped process, with which
Ægeriidae

it cuts through the epidermis of the plant, and then wriggling forward, until half of the body is extruded, the pupal case bursts, and the moth emerges. The males come out in the early afternoon, the females about four o'clock, copulation occurs almost immediately, and the female begins to oviposit before the sun sets. The moths appear at the end of July and throughout August in Pennsylvania. The larvae overwinter in the canes.

Genus VESPAMIMA Beutenmüller
(1) Vespamima sequoiae Henry Edwards, Plate XLVI, Fig. 20, ♂ .
Syn. pinorum Behrens.
This species is said to be very destructive to coniferous trees upon the Pacific slope. The larvae do their mischievous work at the forking of the branches.

Genus PARHARMONIA Beutenmüller
(1) Parharmonia pini Kellicott, Plate XLVI, Fig. 16, ♂ .
The species is found from Canada to New Jersey. The larvae live under the bark of pine-trees. The moths appear in July and August.

Genus SANNINOIDEA Beutenmüller
(1) Sanninoidea exitiosa Say, Plate XLVI, Fig. 18, ♂ , Fig. 19, ♀ .
Syn. persica Thomas; pepsidiformis Hübner; xiphioformis Boisduval.
This is the well-known "Peach-borer." The larvae infest the trunks of peach-trees and wild cherries near the ground, and also attack the upper roots. The species ranges from Canada to Florida, and westward to the Rocky Mountains. It does a large amount of damage in peach-orchards.

Genus ALBUNA Henry Edwards
(1) Albuna pyramidalis Walker, form montana Henry Edwards, Plate XLVI, Fig. 37, ♂ .
This is a variable species, of which several varieties have been described. It ranges from Nova Scotia into New England, and westward to the Pacific in the same latitudes. Nothing is known of its early history or food-plants.
Genus **SYNANTHEDON** Hübner

*Sesia auctorum.*

The name *Sesia* being properly restricted to a genus of the *Sphingidae*, we apply to the genus the name proposed by Hübner in the "Verzeichniss Bekannter Schmetterlinge," p. 129. This appears to be the proper and logical method of procedure under the circumstances.

The genus is very extensive. Fifty-eight species are found in our fauna, of which we delineate eleven.

1. **Synanthedon rileyana** Henry Edwards, Plate XLVI, Fig. 22, ♂, Fig. 23, ♀.

   *Syn. brunneipennis* Henry Edwards; *hyperici* Henry Edwards.

   The species ranges from the Virginias and Carolinas westward through Ohio and Illinois as far as California and Oregon.

2. **Synanthedon rutilans** Henry Edwards, Plate XLVI, Fig. 31, ♂, Fig. 32, ♀.

   *Syn. aureola* Henry Edwards; *hemizone* Henry Edwards; *lupini* Henry Edwards; *perplexa* Henry Edwards; *impropria* Henry Edwards; *washingtonia* Henry Edwards; *madarica* Henry Edwards.

   This insect is known as the "Strawberry-borer." It not only infests the crown of these plants, which it generally destroys, but also frequently attacks raspberries and blackberries at the crown of the roots. It ranges from Nova Scotia westward across the continent, and in the Mississippi Valley southward into northern Texas.

3. **Synanthedon neglecta** Henry Edwards, Plate XLVI, Fig. 30, ♀.

   The insect is found in California and Washington. Its early stages are unknown.

4. **Synanthedon bassiformis** Walker, Plate XLVI, Fig. 21, ♂.

   *Syn. lustrans* Grote; *consimilis* Henry Edwards; *bolli* Henry Edwards; *eupatori* Henry Edwards; *sexfasciata* Henry Edwards; *infirma* Henry Edwards; *imitata* Henry Edwards.

   The larva feeds in the stems of *Eupatorium purpureum*. The insect ranges from New England to Texas.

5. **Synanthedon tipuliformis** Clerck, Plate XLVI, Fig. 26, ♀.

   The insect, which is found in Europe and Asia, and has also
been transported to Australia, is an importation into this country from Europe. It feeds in the stems of gooseberry- and currant-bushes.

(6) **Synanthedon pictipes** Grote & Robinson, Plate XLVI, Fig. 24, ♀.

**Syn. insitata** Henry Edwards.

The larvæ feed under the bark of plums, wild and cultivated cherry-trees, peach-trees, the June-berry (*Amelanchier*), and the chestnut. The eggs are laid on the trunks and the branches of the trees. The moths are on the wing in June and July.

(7) **Synanthedon acerni** Clemens, Plate XLVI, Fig. 28, ♀.

**Syn. acencohim** Gennadius.

This is the common "Maple-borer." The larvæ tunnel in the sap-wood and do a great deal of damage to trees, especially in our larger cities. At times trees are completely girdled by the galleries made by the insects, and are thus killed; at other times they are so weakened that on the occasion of high winds or storms they are broken off and greatly disfigured. The insects emerge from the pupæ early in the morning, and may be seen at times in small swarms about the trunks of the trees, ovipositing upon the bark. The time of emergence is the latter part of May and the beginning of June. The pupæ are formed in small cocoons composed of silk and pellets of excrement interwoven upon the surface. Just before the moths emerge, the chrysalids work their way partially out of the tunnels in which they are, and then the outer sheathing of the pupa splits open and the perfect insect crawls forth, in a few moments to be upon the wing; for the development of the power of flight is with this species, as with almost all the *Ægeriidae*, exceedingly rapid.

The moth is found from New England as far west as Nebraska.
(8) **Synanthedon aureopurpurea** Henry Edwards, Plate XLVI, Fig. 33, ♀.

The moth occurs in Texas. No history of its habits has as yet been written.

(9) **Synanthedon pyri** Harris, Plate XLVI, Fig. 25, ♀.

This is a common species everywhere, infesting the bark of pear- and apple-trees. In the vicinity of Pittsburgh many trees have been killed by these mischievous little creatures.

(10) **Synanthedon scitula** Harris, Plate XLVI, Fig. 29, ♀.

Syn. *gallivorum* Westwood; *hospes* Walsh; *amula* Henry Edwards.

The larvae inhabit the bark of chestnut, dogwood, oak, willow, hickory, and the galls of oaks. The moth ranges from Canada to Virginia, and westward through the Valley of the Ohio.

(11) **Synanthedon albicornis** Henry Edwards, Plate XLVI, Fig. 27, ♀.

Syn. *proxima* Henry Edwards; *modesta* Kellicott.

The moth is not known to occur south of the Potomac and the Ohio. It ranges from New England to Oregon. The larvae feed upon the trunks and shoots of willows.

**Genus CALESESIA** Beutenmüller

(1) **Calesesia coccinea** Beutenmüller, Plate XLVI, Fig. 36, ♀.

The habitat of this rare insect is New Mexico. The male and the early stages are as yet unknown.

**Genus PARANTHRENE** Hübner

(1) **Paranthrene heucherae** Henry Edwards, Plate XLVI, Fig. 35, ♂.

There are several species in the genus found in the United States, which are all, as yet, rare in collections, and little is known as to their life-history. The present species has been found in New Mexico.

**FAUNAL SUBREGIONS**

This volume is an attempt to bring together into compact form an account of the commoner and more striking species of
moths which are found in the United States and Canada. The area is vast, and zoologists as well as botanists have for the purposes of science subdivided the region into what are known as "faunal subregions," or "botanical subregions." These subdivisions of the territory are entirely natural and are based upon a knowledge of the flora and fauna of each area. Both flora and fauna are more or less dependent upon conditions of soil, rainfall, and temperature.

Beginning with the Atlantic coast, we find a large area extending from Nova Scotia, Quebec, and Ontario, southward through New England, the Middle States, and the Eastern Central States as far south as the Carolinas and northern Georgia, Alabama, and Mississippi, westward into Arkansas, Missouri, and eastern Kansas, then northward through eastern Iowa and Minnesota, in which, with some slight variations, the predominant features of the vegetation and of the fauna are alike. In a broad way this territory is known as the Appalachian subregion. It has been subdivided into two parts, to the more northern of which has been applied the name Canadian, and to the southern the name Carolinian. These minor subdivisions of the broader subregion are quite natural, and are based upon the fact that certain groups of plants and animals are characteristic of the one which are not characteristic of the other; yet upon the whole the character of the vegetation and of the animal life of the two lesser areas is in most respects quite similar. The genera are practically the same throughout these territories. It was, when the country was first discovered by white men, a region of trees, except in northern Indiana and parts of Illinois, Iowa, and Minnesota, where there were prairies; but on these prairies, where trees grew, they were for the most part representatives of the same genera which were found through the eastern parts of the domain, and in many cases were the same species. Accompanying the plants are the insects which feed upon them.

Beginning on the extreme southern portions of the coast of North Carolina and running along the coast of South Carolina through eastern and southern Georgia, northern Florida, and westward along the Gulf of Mexico, we have a strip of territory preserving many of the floral and faunal peculiarities of the Appalachian subregion, but possessing distinctive features of its own.
We detect here the influence of warmer skies and the life of the not-far-off tropics. It is the region of the long-leaved pine, the cypress, the live-oak, the evergreen magnolia, and the palmetto. It is the subregion of the Gulf. It has a fauna of its own.

In the extreme southern portion of Florida and on the outlying islands we find established a northern offshoot of the plant-life and of the fauna of the West Indies. The conditions are distinctly tropical here.

A sharp division takes place west of the Mississippi River, at those points where the heavily wooded lands terminate and are succeeded by the grassy, woodless plains, which lie between the western borders of the Valley of the Mississippi and the eastern ranges of the Rocky Mountains. While the Great Plains are traversed by numerous river valleys, in which there is abundant arboreal vegetation, nevertheless the whole region in part only preserves the faunal and floral characteristics of the Appalachian subregion. The southern part of this territory, lying in New Mexico, western Texas, and Arizona, with which, in part, southern California is identified, has a large number of genera and species which range southward along the plateaus and treeless highlands of Mexico and Central America. This may be called the Arizonian or Sonoran subregion.

The northern half of the belt of the Great Plains is invaded by forms of both plant and animal life which are related to types predominant in the colder regions of the continent. This is especially true where the plains reach a great altitude above the level of the sea. This subregion may be called the Dakotan. It stretches from northern Colorado northward to the British provinces of Assiniboia and Alberta.

West of the Great Plains is a territory traversed from north to south by the ranges of the Rocky Mountains, in which there occurs a commingling of genera and species, some coming in from the far north on the higher ranges, others coming in from the south on the lower levels, and a multitude of forms mingling with these which show the influence of migration both from the Great Plains and from the Pacific slope. The region of the Rocky Mountains is a region in which there are singular complexities, owing to the great differences in elevation. Species of the arctic zone may be found having their habitat within a few
iEgeriidae

miles of species which are in many cases distinctly subtropical. On the high peaks holarctic genera occur, and in the valleys genera which have their metropolis in Mexico. In a general sense the territory may be called the Coloradan subregion.

The Pacific subregion includes central and northern California and the valleys lying between the coast and the western outliers of the central cordillera. The subregion extends northward into British Columbia. There is shown here a distinct resemblance to the fauna of Europe and temperate Asia.

Beginning in Labrador on the east and extending across the entire northern portion of the continent into Alaska is a region which we may call the Holarctic subregion, in which the genera and species alike of plants and animals are for the most part the same which are found in similar latitudes in the Eastern Hemisphere. In Alaska there is evidence of a distinct connection between the flora and fauna of Asia. Greenland and Labrador, together with some of the adjacent islands, show remarkable affinities to the flora and fauna of boreal Europe and the Alps.

Various subdivisions of these broader areas have been suggested, but in the main the subregions which the writer has indicated suffice to show the differences in these tracts.

“... From every chink
And secret corner, where they slept away
The wintry storms—or rising from their tombs
To higher life—by myriads, forth at once,
Swarming they pour, of all the varied hues
Their beauty-beaming parent can disclose.
Ten thousand forms! ten thousand different tribes!
People the blaze.”

Thomson.—Summer.
"All multiplicity rushes to be resolved into unity. Anatomy, osteology, exhibit arrested or progressive ascent in each kind; the lower pointing to the higher forms, the higher to the highest, from the fluid in an elastic sack, from radiate, mollusk, articulate, vertebrate, up to man; as if the whole animal world were only a Hunterian Museum to exhibit the genesis of mankind."—EMERSON.

The Pyralidæ constitute an enormous complex of subfamilies, genera, and species. They are found in all the temperate and tropical parts of the world, but are more numerous in hot lands than in the colder portions of the globe. Nearly eight hundred species belonging to this family are already known to occur within the United States and Canada, and the region will undoubtedly yet yield many new species to science. We cannot in these pages undertake to give even an outline of the genera and the species, but we have selected a few for illustration in order that the student, encountering these interesting insects, may be able to at least recognize their relative position in the great suborder with which this book deals.

The moths of this family are described as follows by Sir George F. Hampson in the Proceedings of the Zoological Society of London for 1898, page 590: "Proboscis and maxillary palpi usually well developed; frenulum present. Fore wing with vein 1a usually free, sometimes forming a fork with 1b; 1c absent; 5 from near lower angle of cell; 8, 9 almost always stalked. Hind wing with veins 1a, b, c present; 5 almost always from near lower angle of cell; 8 approximated to 7 or anastomosing with it beyond the cell.

Larva elongate, with five pairs of prolegs. Pupa with segments 9–11 and sometimes also 8 and 12 movable, not protruding from cocoon on emergence."

The Pyralidæ have been divided into a number of subfamilies. Of the subfamilies represented in our fauna, we shall in the following pages give illustrations of a few species which are com-
Pyralidae

monly encountered or possess interesting traits. While it is to be wished that we might be able to give a monographic view of the entire family, such a procedure is wholly out of the question, in view of the limits imposed upon us in the matter of space by such a volume as that which has been undertaken.

SUBFAMILY PYRAUSTINÆ

The genera of this family may be distinguished by the fact that the median nervure is not pectinated upon the upper side, or is at most very slightly pectinated, by the absence of tufts of scales in the cell of the fore wing, and by the further fact that vein 10 of the fore wing rises from the cell. In the hind wing, vein 7 and vein 8 almost invariably anastomose.

Fifty-seven genera are found in our territory, represented by two hundred and twenty-four species.

Genus ZINCKENIA Hübner

(1) Zinckenia fascialis Cramer, Plate XLVII, Fig. 28, δ.
Syn. angustalis Fabricius; recurvalis Fabricius; diffascialis Hübner; albifascialis Boisduval.

The moth is found all over the temperate and subtropical regions of both hemispheres. It is common in the southern portions of the United States.

Genus DESMIA Westwood

(1) Desmia funeralis Hübner, Plate XLVII, Fig. 37, δ.
(The Grape-leaf Folder.)

Fig. 216. — Desmia funeralis. 1, larva secreted between folds of leaf; 2, head of larva, magnified; 3, pupa; 4, male moth; 5, female moth. (After Riley.)

The caterpillar of this pretty little moth feeds upon the leaves
of various wild and cultivated grapes, showing a preference for those species the leaves of which are thin and tender. The caterpillar is of a transparent green color, and is very lively when disturbed. The insects, which do considerable damage in vineyards, may be kept down by crushing the larvæ and the pupæ when found in the folded leaves, which are easily detected. The moth is found from Canada to the Gulf east of the Great Plains.

Genus SAMEA Guenée

(1) Samea ecclesialis Guenée, Plate XLVIII, Fig. 2, ♀.
Syn. castellalis Guenée; leucusalis Walker; dissectalis Walker.
The insect is widely distributed throughout the hotter parts of the Western Hemisphere. It is common in Florida and ranges south as far as Argentina.

Genus DIASTICTIS Hübner

(1) Diastictis fracturalis Zeller, Plate XLVIII, Fig. 1, ♂.
This is a neatly marked species, which is found in Texas and Arizona, and ranges southward into Mexico and Central America.

Genus CONCHYLODES Guenée

(1) Conchylodes platinalis Guenée, Plate XLVII, Fig. 60, ♂.
Syn. ovulalis Guenée; erinalis Walker; marginalis Felder; concinnalis Hampson.
The moth is found in western Pennsylvania and southward through the southern portions of the United States into South America.

Genus PANTOGRAPHA Lederer

(1) Pantographa limata Grote & Robinson, Plate XLVII, Fig. 38, ♂.
Syn. suffusalis Druce.
The insect occurs from Maine to Patagonia.

Genus AGATHODES Guenée

(1) Agathodes monstralis Guenée, Plate XLVIII, Fig. 3, ♂.
Syn. designalis Guenée; floridalis Hulst.
The moth ranges from Florida to the Rio de la Plata in South America.
Genus **GLYPHODES** Guenée

This is a large genus, represented in both hemispheres by numerous species. We give figures of three.

(1) **Glyphodes nitidalis** Stoll, Plate XLVII, Fig. 43, ♂.
(The Pickle-worm.)

The insect feeds in its larval stage upon cucumbers and melons, into which the caterpillar bores. A good account of its habits is given by Riley in the "Second Annual Report of the State Entomologist of Missouri," page 67. It has, like most of the *Pyralidae*, a wide range, and extends from the southern portions of the United States to the southern portions of South America.

(2) **Glyphodes hyalinata** Linnaeus, Plate XLVII, Fig. 39, ♂.
*Syn. marginalis* Stoll; *lucernalis* Hülber; *hyalinata* Guenée.

The range of this species is very much the same as that of the last mentioned.

(3) **Glyphodes quadristigmalis** Guenée. (The Privet-moth.)

![Fig. 217. — Glyphodes quadristigmalis. a, lateral view of larva; b, dorsal view; c, cocoon; d, moth; e, lateral view of two segments of larva, enlarged; f, anal segment of pupa from below, greatly enlarged. (After Riley, "Insect Life," Vol. I, p. 24.)](image)

This moth has in recent years proved at times troublesome as an enemy of privet-hedges in the southern portions of the country. As many as four broods of the moths have been detected in one
Explanation of Plate XLVII

(Unless otherwise indicated, the specimens represented are contained in the collection of W. J. Holland.)

59. Hypsopygia costalis Fabricius,  
60. Conchylodes platinalis Guenée,  

summer in Washington, D. C. The insect has a wide range, being known to occur in the West Indies and Central America.

**Genus PHLYCTÆNODES Guenée**

This is a genus well represented in both hemispheres. There are over thirty species found in the United States.

(1) *Phlyctaenodes triumphalis* Grote, Plate XLVIII, Fig. 5, 6.  
This species, which is found in the vicinity of San Luis Obispo, California, was described by Grote in the "Canadian Entomologist," Vol. XXXIV, p. 295. It does not appear in Dyar's List.

(2) *Phlyctaenodes sticticalis* Linnaeus. (The Sugar-beet Moth.)  
Syn. *fuscalis* Hübner; *tetragonalis* Haworth; *sordida* Butler.

The moth, of which we give an enlarged representation in Fig. 218, has become in recent years the object of attention in those portions of the West in which the cultivation of the sugar-beet has become an industry of magnitude. It has done considerable damage to the crop in Nebraska. There are two and perhaps three broods produced in a year. The insect multiplies with great rapidity, and large areas planted with the beet have been defoliated by the caterpillars in comparatively a short time. The larvæ hibernate in cases woven of silk to which particles of earth are adherent, and which are formed at a small depth under the surface of the soil. By harrowing the ground it has been ascertained that many of the cases are thrown up, and are emptied of the larvæ by the meadow-larks and other insectivorous birds, or are killed by the frosts of winter. Many of them, however, escape such treat-
ment, being possessed of vitality enough to withstand a great
degree of cold. It has been suggested that a better way in
which to rid the fields of the pests is to apply Paris green to the
beets, in a solution composed of one pound of the poison to two
hundred gallons of water. The spraying of the plants by the
mixture is said to have proved efficacious in cases where the

application was made as soon as it was ascertained that the in-
sects were at work upon the leaves. Nature in this case, as in
multitudes of others, comes to the assistance of the agriculturist,
and there is a parasite which destroys many of the larvæ. The
cocoon of one of these is shown in Fig. 220.

The moth occurs in Europe as well as in America, and it is
possible that the insect has been imported from the Old World.

(3) Phlyctaenodes oberthuralis Fernald, Plate XLVIII, Fig.
4, ♂.

The species occurs in California and Arizona.

Genus TITANIO Hübner

(1) Titanio proximalis Fernald, Plate XLVIII, Fig. 6, ♂.
The moth is a native of California. The genus to which it
belongs is represented in our fauna by a number of species.

"And your spoil shall be gathered like the gathering of the caterpillar."

ISAIAH.—XXXIII, 4.
Genus PHLYCTÆNIA Hübner

(1) Phlyctænia tertialis Guenée, Plate XLVII, Fig. 47, ♂.
   Syn. plectilis Grote & Robinson; syringicola Packard.
   This is a common species in the eastern portion of the region. It is very abundant about Pittsburgh. The genus is represented in our fauna by a dozen species.

Genus CINDAPHIA Lederer

(1) Cindaphia bicoloralis Guenée, Plate XLVII, Fig. 40, ♂.
   Syn. julialis Walker; incensalis Lederer; amiculatalis Berg; pulchripictalis Hampson.
   The moth occurs from New York and New England southward to the temperate regions of South America. It is the only representative of the genus in our fauna.

Genus PYRAUSTA Schrank

This is a very large genus, which is well represented in both hemispheres. There are about sixty species known to occur within our territory.

(1) Pyrausta pertextalis Lederer, Plate XLVII, Fig. 54, ♂.
   Syn. gentilis Grote; thalesalis Zeller.
   The species ranges from New England to the extreme southern portions of our region.

(2) Pyrausta langdonalis Grote, Plate XLVII, Fig. 52, ♂.
   The moth occurs in western Pennsylvania and Ohio and Indiana.

(3) Pyrausta orphisalis Walker, Plate XLVII, Fig. 49, ♂.
   Syn. adipaloides Grote & Robinson.
   The insect is not uncommon in the Middle Atlantic States.

(4) Pyrausta fumalis Guenée, Plate XLVII, Fig. 55, ♂.
   Syn. orasusalis Walker; badipennis Grote.
   The species is found in the eastern portions of our territory. It is not uncommon in Pennsylvania.

(5) Pyrausta illibalis Hübner, Plate XLVII, Fig. 48, ♀.
   Syn. arsaltealis Walker; euphasalis Walker; guttulosa Walker; fascialis Walker; subjectalis Lederer; magniferalis Walker.
   The moth, which is somewhat variable in its markings, is found in the Appalachian subregion.

(6) Pyrausta unifascialis Packard, Plate XLVII, Fig. -1, ♂.

397
Pyralidae

Syn. *subolivalis* Packard; *hircinalis* Grote; *obnigralis* Hulst.
The moth is known to occur in the northern portions of the United States and to range westward to California.

(7) **Pyrausta insequalis** Guenée, Plate XLVII, Fig. 41, ♂.

Syn. *subsequalis* Guenee; *madetesalis* Walker; *repletalis* Walker; *efficitalis* Walker.
The species inhabits the Appalachian subregion.

(8) **Pyrausta ochosalis** Fitch, MS., Plate XLVII, Fig. 57, ♀.

This species, which is not at all uncommon in Pennsylvania, is in many collections confounded with *P. generosa* Grote & Robinson, which it resembles in a general way. The insect is prevalently smaller than the latter species, and the markings are different. The species has been correctly discriminated in the collection of the United States National Museum from *P. generosa*, and the name applied to it in manuscript by Fitch is there given it. I have used this name in designation of the species.

(9) **Pyrausta tyralis** Guenee, Plate XLVII, Fig. 44, ♂.

Syn. *erosnealis* Walker; *diffissa* Grote & Robinson; *bellulalis* Hulst.
The species ranges from the Valley of the Ohio southward to Texas.

(10) **Pyrausta unimacula** Grote & Robinson, Plate XLVII, Fig. 56, ♂.
The insect is common in Pennsylvania and the Valley of the Ohio.

(11) **Pyrausta funebris** Strôm, Plate XLVII, Fig. 50, ♂.

Syn. *octomaculata* Linnaeus; *glomeralis* Walker.
This pretty and distinctly marked species, which in the pattern of its wings recalls the markings of the genus *Alypia*, is found in the northern parts of temperate North America and in Europe.

(12) **Pyrausta niveicilialis** Grote, Plate XLVII, Fig. 42, ♀.
The moth is found from New England to western Pennsylvania and the Valley of the Ohio as far west as southern Indiana.

Genus **EUSTIXIA** Hübner

(1) **Eustixia pupula** Hübner, Plate XLVII, Fig. 58, ♂.
The insect is found throughout the Appalachian subregion. It is freely attracted to light and also to sugar. It is common in Indiana.
Genus CORNIFRONS Lederer

(1) \textit{Cornifrons simalis} Grote, Plate XLVIII, Fig. 7, \&.
The range of the moth is from Montana to Oregon.

\textbf{nus NOCTUELIA Guenée}

(1) \textit{Noctuelia thalialis} Walker, Plate XLVIII, Fig. 9, \&.
\textit{Syn. peruviana} Walker; \textit{gelidalis} Walker; \textit{novalis} Grote; \textit{costamaculalis} Snellen.
The insect is found in the Gulf States and southward through South America.

\textbf{SUBFAMILY NYMPHULINÆ}

The insects composing this family are generally found in the vicinity of water, the larvæ feeding for the most part upon aquatic plants. Four genera belonging to the subfamily are recognized as occurring within our limits. We give an illustration of one of the commoner species.

Genus NYMPHULA Schrank

(1) \textit{Nymphula obscuralis} Grote, Plate XLVIII, Fig. 10, \&.
The insect occurs from Maine to Minnesota, and southward into Pennsylvania and West Virginia.

\textbf{SUBFAMILY SCOPARIINÆ}

The \textit{Scopariinæ} are represented in our fauna by the genus \textit{Scoparia} alone. Seven species belonging to this genus are attributed to it in the last published list of the Lepidoptera of the United States.

\textbf{SUBFAMILY PYRALINÆ}

Five genera belonging to this subfamily occur within our territory. Of these we have selected for illustration specimens representing three of the genera.

Genus HYPSOPYGIA Hübner

(1) \textit{Hypsopygia costalis} Fabricius, Plate XLVII, Fig. 59, \&.
\textit{(The Clover-hay Worm.)}
\textit{Syn. jambrialis} Denis \& Schiffermüller.
This troublesome little species is no doubt an importation from Europe, where it is very common. It has spread from the Atlantic to the Rocky Mountains. It has the habit of infesting stacks of clover-hay, and often does a great deal of damage by weaving its webs of fine whitish silk mixed with excrement in the hay and devouring the leaves. Many cases have been reported in which hay had been rendered entirely unfit for use by the presence of these pests. As the larvae feed upon dried clover, it has been recommended to make it a point not to stack new hay in places where the old hay is known to have been infected. Furthermore, as the larvae are known to prefer hay which is somewhat moist, it is recommended to make it a point to stack the hay in such a manner that it cannot be subjected to an excess of moisture. This may be done by building the stacks upon a framework of rails elevated a little distance above the ground, so as to permit of the circulation of air beneath.

Genus **PYRALIS** Linnaeus

(1) **Pyralis farinalis** Linnaeus, Plate XLVII, Fig. 53, 9. (The Meal Snout-moth.)

This is a cosmopolitan species, being quite abundant everywhere. It manifests a decided preference for cereals in almost any form, and feeds upon meal, bran, and even the straw and husks. It undergoes twice the size of life.

---

**Pyralidae**

Fig. 221.—*Hypopygia costalis*. 1–2, larvae; 3, cocoon; 4, pupa; 5–6, moth; 7, larva covered with silken web. (After Riley.)

Fig. 222.—*Pyralis farinalis*. a, moth; b, larva; c, cocoon. (After Chittenden, "Bull. U. S. Dept. Agric.," New Series, Vol. IV, p. 119.) All figures 400.
transformation quite rapidly and is known to produce as many as four generations in a year. The caterpillars prefer the dark corners of meal-bins and the nooks of granaries and elevators which are least disturbed, and here will, unless they are detected and their ravages checked, establish centers of infection, from which they will go forth to do a vast amount of mischief. The caterpillars form long cases or tunnels of silk mixed with the debris of their food, in which they are quite effectually concealed from view. The best remedy is cleanliness, and frequent moving of stored products.

Genus HERCULIA Walker

(1) Herculia olinalis Guenée, Plate XLVIII, Fig. 13, ♂.
Syn. tretonalis Lederer.
The species is widely distributed throughout the United States and Canada. The larvæ feed upon the leaves of the oak.

(2) Herculia himonialis Zeller, Plate XLVII, Fig. 46, ♀.
The moth is found from New England to Pennsylvania. It is not uncommon among the Alleghany Mountains about Cresson.

SUBFAMILY CHRYSAUGINÆ

This is a small subfamily, represented in our fauna by nine genera. Two of these we have selected for representation.

Genus SALOBRANA Walker

(1) Salobrana tecoma Riley, Plate XLVIII, Fig. 11, ♀.
This curious little moth feeds in its larval state upon the interior of the seed-pods of the common trumpet-vine (Tecoma). The eggs are deposited when the pods are forming, and the larvæ develop within them until in the fall, when they become dormant, hibernating in their burrows until the following spring, when they prepare for their escape by making an orifice in the outer shell of the pod and transforming into pupæ. An excellent account of their habits has been given by the late Professor C. V. Riley in the “American Entomologist,” Vol. III, p. 288. The moth is found in the southwestern portions of the United States, in the West Indies, and in Mexico and Central America.
Pyralidae

Genus TOSALE Walker

(1) Tosale oviplagalis Walker, Plate XLVIII, Fig. 33, ♂.
Syn. nobilis Grote; anthcecioides Grote & Robinson.
This is a common insect in western Pennsylvania, coming freely to sugar. It ranges from the eastern portions of our territory southward into South America.

SUBFAMILY SCHENobiinae

This is a small subfamily of peculiar moths in which the proboscis is wanting, and which are represented in our territory by four genera and a dozen or more species. Of these we have selected one for illustration.

Genus SCIRPOPHAGA Treitschke

(1) Scirpophaga perstrialis Hübner, Plate XLVIII, Fig. 12, ♀.
Syn. serriradiellus Walker; macrinellus Zellner.
The habitat of this moth is the southern part of Florida.

SUBFAMILY CRAMBINAE

The Crambinae, or “Grass-moths,” as they are commonly called, constitute a large subfamily. The North American species have been well described and delineated by Fernald in his little book entitled “The Crambidae of North America,” which was published in 1896. To this the student will do well to refer. There are fourteen genera in our territory, and over eighty species. Only a few of these can be represented in our plates.

Genus CRAMBUS Fabricius

(1) Crambus laqueatellus Clemens, Plate XLVIII, Fig. 17, ♂.
Syn. semifusellus Walker.
The moth ranges from New England to Texas. Like all the other species of the genus, it feeds in its larval state upon the grasses.

(2) Crambus alboclavellus Zeller, Plate XLVIII, Fig. 18, ♂.
The insect is very common in the Appalachian subregion.

(3) Crambus turbatellus Walker, Plate XLVIII, Fig. 19, ♀.
Syn. bipunctellus Zeller.

402
The insect occurs from Canada and New England in the North to the Potomac and the Ohio in the South.

(4) **Crambus trisectus** Walker, Plate XLVIII, Fig. 20, ♀.

*Syn. interminellus* Walker; *exsicatus* Zeller; *biliturellus* Zeller.

This is a very common and widely distributed species, ranging from the Atlantic to the Pacific through more temperate latitudes.

**Genus DIATRÆA** Guilding

(1) **Diatraea saccharalis** Fabricius. (The Larger Corn-stalk Borer.)

*Syn. leucaniellus* Walker; *lineosellus* Walker; *obliteratellus* Zeller; *cramboides* Grote.

As early as the year 1828 the attention of the world was called to the damage inflicted upon the sugar-cane in the West Indies by the larva of a lepidopterous insect. The author of the paper in which it was described was the Rev. Lansdown Guilding, who was awarded a gold medal by the Society of Arts for his account of the insect. About thirty years later, attention was called to the ravages of a similar insect in the island of Mauritius, into which it had been introduced. From the West Indies the insect was transported to Louisiana, and a study of its pernicious habits was accurately made in the year 1881 by Dr. L. O. Howard of the United States Department of Agriculture. It had been known in Louisiana as a pest since 1855.

Fig. 223.—*D. saccharalis.* *a, b, c,* varieties of larva, enlarged; *d,* third thoracic segment; *e,* eighth abdominal segment; *f,* abdominal segment from side; *g,* same from above, enlarged. (After Howard, "Insect Life," Vol. IV, p. 101.)
Pyralidæ

The ravages of the insect are not confined to the sugar-cane. It attacks with equal avidity sorghum and the stalks of the common Indian corn, or maize. The insect has gradually worked its way northward from the region of the Gulf, having found lodgment here and there throughout the Southern States, and is now known to occur quite abundantly at times as far north as Maryland. It is double-brooded in Virginia.

The most serious damage is inflicted upon the crop where the larvae attack young stalks. Plants which are older and well established, though they may suffer to some extent from the insects, are generally not damaged sufficiently to prevent the maturing and hardening of the grain; but where the stalks are young and quite tender, they fail to mature, are stunted, sicken, and ultimately die. The accompanying figure shows the dwarfed and sickly appearance of such a stalk, which has been invaded by the borer. The life-history of the insect has been briefly given by Howard as follows: "In early spring the parent moth lays her eggs upon the young cane near the axils, and the young borer penetrates the stalk at or near the joint, and commences to tunnel, usually upward, through the soft pith. The larval growth is rapid, and the borer is active,
and frequently leaves the stalk at one place and enters at another, making several holes in the course of its growth. When ready to transform, it burrows to the surface, making a hole for the exit of the future moth, and transforms to the pupa state. There are several generations in the course of a season, and the insect hibernates in the larval state within the stalks.”

The fact that the insect makes its home in the winter months in the dry stalks furnishes the means for most effectually combating its attacks. The remedy is found in destroying the stalks, either by burning them or by gathering them up and feeding them to live stock. It is well known that where crops are rotated, and the stalks are not left standing in the fields all winter, the insect does not succeed in inflicting much damage. Careful and intelligent tillage of the soil, cleanliness in the fields, will do much to prevent the increase of these insects, as well as of many other injurious species which might be named. In addition to feeding upon sugar-cane, sorghum, and corn, it has been ascertained that the insect will attack “Gama-grass” (*Tripsacum dactyloides*), and it is recommended to burn over fields in which this grass grows in proximity to corn-fields. The student who is desirous to know more about this insect may consult the pages of “Insect Life,” Vol. IV, p. 95, where Dr. Howard has written at length upon its habits. It is from this article that much of the information contained in the preceding paragraphs has been drawn.

**SUBFAMILY GALLERiINÆ**

This is a subfamily the larvae of at least one species of which have the remarkable habit of making their abode in the hives of
bees, where they feed upon the wax and destroy the young of
the insects upon whose industry they prey.

Genus GALLERIA Fabricius

(1) Galleria mellonella Linnæus. (The Bee-moth.)
Syn. cereana Linnæus; cerella Fabricius; obliquella Walker.

The Bee-moth was undoubtedly introduced into this country
from Europe. It is a well-known enemy of the apiarist, and has
been active in doing mischief on this side of the Atlantic for more

Fig. 226.—The Bee-moth. a, larva; b, cocoon; c, pupa; d,
female moth with wings expanded; e, male moth with wings closed.
(After Riley.)

than a century, while it has been known from time immemorial
in Europe as one of the most dreaded pests of the hive. The
moth is double-brooded, the first generation appearing on the
wing in the latter part of May and the beginning of June, and
the second in August. We cannot do better than to quote in
this connection the following account of the insect which is given
by Professor C. V. Riley in the "First Annual Report of the State
Entomologist of Missouri," p. 166:

"During the daytime these moths remain quietly ensconced in
some angle of the hive, but, as night approaches, they become
active, and the female uses her best endeavors to get into the
hive, her object being to deposit her eggs in as favorable a place
as possible. Wire-gauze contrivances are of no avail to keep her
out, as she frequently commences flying before all the bees have
ceased their work. But even if she were entirely prevented from
entering the hive, she could yet deposit her eggs on the outside,
or, by means of her extensile ovipositor, thrust them in between
the slightest joint or crack, and the young worms hatching from
them would readily make their way into the hive. The moment
the worm is hatched, it commences spinning a silken tube for its protection, and this tube is enlarged as it increases in size. The worm cuts its channels right through the comb, feeding on the wax, and destroying the young bees on its way. When full-grown, it creeps into a corner of the hive or under some ledge at the bottom, and forms a tough white cocoon of silk mingled with its own black excrement, as shown in Figure 226, b. In due time the moth emerges from this cocoon.

A worm-infested hive may generally be known by the discouraged aspect which the bees present, and by the bottom-board being covered with pieces of bee-bread mixed with the black gunpowder-like excrement of the worm. . . . If a hive is very badly infested with the worm, it is better to drive out the bees and secure what honey and wax there may be left than to preserve it as a moth-breeder to infest the apiary. If put into a new hive, the bees may do something; and if they do not, there is no loss, as they would have perished, finally, from the ravages of the worm."

**SUBFAMILY EPIPASCHIINÆ**

This subfamily is represented in our fauna by fourteen genera and about thirty species. The insects may generally be recognized and separated from allied forms by the fact that the cell of the fore wing is adorned by tufts of raised scales. We have only space to give an illustration of a single genus and species.

**Genus YUMA Hulst**

(1) *Yuma trabalis* Grote, Plate XLVIII, Fig. 14, ♀.

*Syn. adelatalis* Hulst.

The insect is found in Colorado and Wyoming, and ranges southward into Texas. Almost all of the *Epipaschiinae* found within our territory are native to the West and the Southwest, only a few species being found in the eastern portions of the United States.

**SUBFAMILY PHYCITINÆ**

This is a very extensive group of moths, which have been admirably monographed by the late Mons. E. L. Ragonot of Paris, in the "Mémoires sur les Lépidoptères," Vols. VII and
Pyralidæ

VIII. There are represented in our fauna over sixty genera and more than two hundred species. We can give our readers merely a glimpse into this corner of the field, but trust that what they shall see may impel them to undertake for themselves the pleasant task of diligent exploration, assuring them that they will find here a world of wonders with which to deal.

Genus ACROBASIS Zeller

(i) Acrobasis betulella Hulst, Plate XLVIII, Fig. 15, ♀.

This is a common species, ranging from New England to Colorado. There are nearly a dozen other species of the genus known to occur in our fauna, and no doubt many more which have not yet been discovered and described.

Genus MINEOLA Hulst

(i) Mineola juglandis Le Baron. (The Walnut Case-bearer.)

This little moth lives in its larval stage upon the leaves of the hickory and walnut. It has the habit of drawing together two of the opposite leaves attached to the long petiole, and between them it builds a case, which is quite straight and is composed of silk, attached to which is excrementitious matter, which is neatly and closely applied to the whole. In this case the larva lives until the cooler airs of autumn warn it to leave the petiole of the compound leaf, which will fall presently, and it then anchors its little case to the twig near by, and in a half-grown state prepares for the cold winds and icy temperature of winter. When again spring sends the sap up the branches, and the leaves begin to unfold, it cuts the bands of silk which held the case in place, and completing its development
upon freshly grown and sapid food, it is transformed into a pupa, from which the moth presently emerges. The moth closely resembles the next species, but the student, by the study of its habits and of the case, which is always straight, and not crooked, as is that of the following species, may at once discriminate it.

(2) Mineola indigenella Zeller. (The Rascal Leaf-crumpler.)

This moth is common in the Valley of the Mississippi and in Ontario, but does not appear to be very common in the Eastern States, and is unknown in the extreme southern portions of our region. It is very common in western Pennsylvania.

Professor C. V. Riley describes its habits as follows: "It is one of those insects which is hardly noticed while it is carrying on its most destructive work; for it is most voracious during the leafy months of May and June, and is then more or less hidden by the foliage of the tree, which it so effectually helps to denude. But the nakedness of winter, though it does not reveal the surreptitious worm, lays bare and renders conspicuous its little house, and these houses—these larval cases—whether closely attached in clusters to the twigs as in Figure 228, b, or hidden in a few seared and silk-sewn leaves as at Figure 229, are unerring tokens of past injury to the tree, and symbols of increased injury in the future, unless removed. The bunches of leaves anchored to the tree by strong silken cables and breasting defiantly every winter's wind are, indeed, significant insignia upon which is written in characters, if not in words—'result of careless culture and unpardonable neglect.'

There is but one brood a year, and the larva, about one-third
grown, invariably passes the winter protected in its case. At this season of the year it is always of a deep reddish-brown color. As the leaves expand in spring it rouses from its winter lethargy, and after ‘heaving anchor’—to use a nautical expression—by severing the silken connections of its case, travels in search of food, and having found it, secures its case again, and breaks its long fast. Toward the end of May it acquires its growth, when the earlier brown color frequently takes on a more or less decided deep green hue. It is a smooth worm with the head and thoracic joints as represented at c. The case at this time usually presents the appearance of Figure 228, a, being crooked and twisted like a little horn, gradually enlarging, cornucopia-fashion, from tip to mouth, and reminding one strongly of a piece of bird-dung. It is formed of the worm’s excrement and other debris, interwoven with silk, and is completely lined on the inside with a carpet of the last-named material. The worm leaves it for feeding purposes mostly during the night. The chrysalis is formed inside this case, and the moths commence to make their appearance during the fore part of June, and later as we go farther north.”

The insect feeds principally upon the Rosaceae, and is very injurious to orchards, attacking apple-trees, plums, quinces, cherries, and certain varieties of pears, especially the Seckel pear.

**Genus AMBESA Grote**

(1) *Ambesa laetella* Grote, Plate XLVIII, Fig. 16, ɔ. The moth is not uncommon in Colorado, Wyoming, and Utah. It is found in the sage-brush in August.

**Genus MELITARA Walker**

(1) *Melitara fernaldialis* Hulst, Plate XLVIII, Fig. 8, ♀. The insect is not at all uncommon in Arizona, and is also said to occur in Mexico.
Genus ZOPHODIA Hübner

(1) Zophodia grossulariae Riley. (The Gooseberry Fruitworm.)

Syn. turbitella Grote.

The larva of this little moth, which is glass-green, feeds upon currants and gooseberries as they are forming upon the branches, hollowing out their interiors, and often fastening a cluster of them together with a web of silk. The berries attacked by the larvae do not generally fall to the ground, but shrivel up where they are, attached to the stalk. The caterpillars transform into pupae on the ground, under leaves and among rubbish. There is but one brood during the year.

The insect is widely distributed from New England and southern Canada westward and southward into the Valley of the Ohio and the upper portions of the Mississippi Valley.

Genus CANARSIA Hulst

(1) Canarsia hammondi Riley. (The Apple-leaf Skeletonizer.)

The larva of this little moth feeds upon the parenchyma, or soft green pulpy covering of the leaves, of the apple and allied trees, leaving the framework of veins and veinlets untouched. Sometimes it devours all of the upper surface of the leaf and completely skeletonizes it; more frequently it only eats portions here and there. In the fall of the year orchards are often made to appear quite sear and blighted by the inroads of the minute larvae, which are gregarious and are at times found literally in millions upon the trees.

The insect has an extensive range, and is found from New
Pyralidæ

England and Ontario southward through the valleys of the Ohio and the Mississippi as far as northern Texas.

By weakening the trees the larvæ cause the fruit to fall prematurely, and not a little damage is thus caused to the crop. It has been recommended to treat trees which are infested by the insect to a dust-bath made of air-slaked lime. It is said that this has the effect of destroying the larvæ. A better method of procedure is to give the trees a spraying with a very weak solution of one or the other of the coal-oil emulsions which are in use as disinfectants in orchards.

Genus EPHESTIA Guenée

(i) Ephestia kuehniella Zeller. (The Flour-moth.)
Syn. gitonella Druce.

This wretched pest, the original habitat of which is not known, has within recent years caused a great deal of trouble and expense to millers and dealers in grain on both sides of the Atlantic. It is believed by many European entomologists to be of American origin, but this cannot be proved. Others hold that it is an importation from the Orient, and it goes under the name of the Mediterranean Flour-moth in some localities. Wherever the creature came from, it is a decided plague. Rapidly multiplying, it takes possession of mills and grain-warehouses, and

![Fig. 232. - E. kuehniella. (All figures greatly enlarged.) a, larva; b, pupa; c, moth; d, enlarged head of larva; e, enlarged segment; f, moth at rest; g, front wing, showing characteristic markings; h, i, neuration of wings. (After Riley, "Insect Life," Vol. II, p. 166.)](image-url)
Explanation of Plate XLVIII

45. Adela bella Chambers, ♂.
Pyralidae seems to defy attempts to eradicate it. Each female lays from six to seven hundred eggs, and the process of generation seems, where buildings are warm, to go on continuously. Moving and airing the wheat does no good, as the insect seems to multiply in the pipes in which flour is transported in a mill from one place to another by air-pressure. Much damage is done by the habit which the larvae possess of gnawing the fine gauze of the screens in a flour-mill.

When the insect has once established itself in an elevator or mill, the only remedy appears to be to shut down, and thoroughly clean the place from top to bottom, and keep shut down and go on cleaning until not a nook or cranny is known to harbor the larvae, cocoons, or moths. The accompanying illustrations, which are taken from the pages of "Insect Life," Vol. II, will enable the student to recognize this creature in its various stages of development.

Thus far it has not become universally distributed throughout the country, but it has appeared in alarming numbers in some parts of Canada and New England. In England, Germany, and Belgium its attacks have been the subject of frequent comment. It shares an unenviable reputation with another species of the same genus, which we shall presently speak of, and with a species of *Plodia*, of which we shall also have something to say.

"Bee to the blossom, moth to the flame; Each to his passion; what 's in a name?"

**Helen Hunt Jackson.**—*Vanity of Vanities.*

413
Pyralidae

(2) Ephesia cautella Walker. (The Dried-currant Moth.)

Syn. cahiritella Zeller; pasulella Barrett; desuetella Walker.

This insect, which in many respects closely resembles the preceding species, like it is destructive to stored food-products. It is known to feed upon Zante currants, raisins, cacao-beans, or chocolate-nuts, on flax-seed, flax-meal, and figs. It is regarded as probable that upon occasion it may develop a tendency to feed upon almost any substance which, containing nutriment, accords in its general character with the commodities which have been named. It is especially likely to attack dried fruits of any kind in which there is sugar or oil. That the insect has been introduced from abroad into our fauna is beyond reasonable doubt. Its ravages on the other side of the Atlantic have been described by writers long ago, while its appearance in this country seems to date from about the time of the Atlanta Cotton Exposition.

Just as most of the common weeds in our fields are of European origin, having been brought over in the seeds which were originally imported, or at a later time in the hay and straw which are used to stuff crates and packing-boxes, so many of the destructive insects, which have greatly multiplied in America, are foreign in their origin. It is not without reason that the government maintains a set of officers, whose function it is to inspect vegetable importations for the purpose of quarantining those which appear to be likely to introduce insect pests. Had the custom of quarantining plants been instituted earlier, our farmers would to-day be happier.
Genus PLODIA Guenée

(1) Plodia interpunctella Hübner. (The Indian-meal Moth.)

Syn. zoe Fitch.

The larva of this moth has a propensity to feed upon almost anything edible which comes in its way. It feeds upon Indian meal with particular avidity, but does not disdain grain of any kind, whole or ground. It breeds in all sorts of dried fruits and vegetables. It eats English walnuts, is said to invade beehives, and is known at times to damage herbariums and to attack collections of dried insects. There is nothing which seems to come amiss to its appetite, and it is, when established in a house or store-room, a veritable nuisance. There are, according to the temperature of the building which it inhabits, from four to seven generations a year, and the reader of these lines will do well to remember that if the thing has established itself under his roof it will require industry, patience, and great regard to cleanliness and order to get rid of it.

FAMILY PTEROPHORIDÆ

"Nature never did betray
The breast that loved her; 't is her privilege,
Through all the years of this our life, to lead
From joy to joy."

Wordsworth.

The Plume-moths, as they are called, constitute a comparatively small family of elegant insects, in which the wings are divided in such a manner as to suggest feathers. The hind wings are generally trifid, sometimes quadrifid; the fore wings are generally bifid, sometimes trifid. The larvae are slow in movement, clumsy in appearance, and live on the surface of leaves. They
Pteroporidae

are generally hairy. The pupae are very remarkable, being soft and hairy like the caterpillars, and attached in pendant position by the cremaster, very much as the chrysalids of some butterflies, though a few have rudimentary cocoons in the form of strands of silk thrown about them. There are six genera and about sixty species of Plume-moths known to occur in the United States. We can take space to represent only one of these species.

Genus OXYPTILUS Zeller

(1) Oxyptilus periscelidactylus Fitch. (The Grape-vine Plume.)

An exceedingly readable and very interesting account of the habits of this insect, which is universally distributed over the whole Appalachian subregion, is given by the late Professor Riley in the "Fourth Missouri Report." The moths may generally be found in vineyards and about grape-vines, when they are beginning to put out their leaves. The eggs are laid on the branches before they begin to blossom, and about the time the third bunch of grapes on a given shoot is beginning to mature, it will be found that the terminal leaves have been drawn together with a few strands of silk, and in the tangle thus prepared, under cover from heat and rain, will be found the curious little caterpillars of the Plume-moth. The accompanying cut, taken from the paper of Professor Riley to which allusion has been made, will serve to tell the story better than can be done in brief compass by words.

The damage done by the insects is not usually very great, and it is an easy matter for the vine-grower, when he discovers the leaves drawn together in the way pointed out, to pluck off the end of the shoot and destroy the insects.

416
FAMILY ORNEODIDÆ

"Very close and diligent looking at living creatures, even through the best microscope, will leave room for new and contradictory discoveries."

GEORGE ELIOT.

This is a very small family of moths, represented in our fauna by but a single genus and species. The moth has both the fore and the hind wings divided into six plumes, as is the case in all the insects of the family.

Genus ORNEODES Latreille

(1) Orneodes hexadactyla Linnaeus. (The Six-plume Moth.)

The moth, which measures half an inch in expanse of wings, is found in Europe and in the cooler portions of North America, exclusive of the arctic regions. It has been reported to occur as far south as Missouri, but is more commonly found in New England, New York, Canada, Manitoba, and the Northwestern States on the Pacific coast. It is nowhere apparently a common insect, or else is overlooked by collectors on account of its small size.

FAMILY TORTRICIDÆ

"Die Kritik nimmt oft dem Baume Raupen und Blüthen mit einander."

JEAN PAUL RICHTER.

The Tortricidae constitute a very large assemblage of genera and species. Because of the habit of the larva of many species of rolling up the leaves of the plants on which they feed, these insects have been often called "Leaf-rollers." Many of the larva live in the inside of the stems of plants, or burrow in fruits, and the famous "jumping-beans" of New Mexico and Arizona are simply the seeds of a species of Croton or Sebastiania in
Tortricidae

which is lodged the larva of a species of Tortricid, which has the power, by changing its position on the inside of the seed, of making the seed move. In the case of Croton seeds the insect is *Cydia saltitans* Westwood; in the case of Sebastiania seeds the insect imparting the motion to the thing is the larva of *Enarmonia sebastiania*.

It is quite impossible for us in a work of the present scope to give even an epitome of the nearly five hundred species of Tortricids which are at present known to occur within the limits of the United States and Canada. We shall content ourselves with an account of a few species, which will serve to show the reader what a mine of interesting inquiry presents itself to view in this single family of beautiful little moths.

**Genus EUCOSMA Hübner**

(1) *Eucosma scudderiana* Clemens. (The Misnamed Gall-moth.)

Syn. *saligneana* Clemens; *affusana* Zeller.

The moth was called "the Misnamed Gall-moth" by Professor Riley because Clemens had given it a specific name which implied that it was a denizen of willow-trees or willow-galls, when in fact it has been ascertained to live in the galls of the Goldenrod (*Solidago*). The insect is not uncommon in western Pennsylvania, and is possibly an inquiline or intruder in the galls, which are produced by another species, *Gnorimoschema gallæsolidaginis* Riley.

(2) *Eucosma dorsisignatana* Clemens, Plate XLVIII, Fig. 27, δ.

Syn. *similana* Clemens; *distignana* Walker; *clavana* Zeller; *graduatana* Walsingham.
This is a common species in the Appalachian subregion. It is found abundantly in western Pennsylvania.

**Genus ANCYLIS Hübner**

(1) Ancylis comptana Frölich. (The Strawberry Leaf-toller.)

Syn. conflexana Walker; fragaria Walsh & Riley.

This little insect has proved a very destructive foe of the strawberry in parts of the Mississippi Valley. There are two broods annually. The insects roll up the leaves, and feeding upon the tender parenchyma, cause the plants to wither and dry. So bad have the ravages of the larvae proved in some places that horticulturists have been led to abandon growing strawberries in those localities. The insect is found in Canada and in the portions of the United States immediately south of the Great Lakes. Although the moth occurs in western Pennsylvania, no great loss from its attacks has as yet been reported from this part of the country.

**Genus ECDYTOLOPHA Zeller**

(1) Ecdytolopha insiticiana Zeller, Plate XLVIII, Fig. 29, ♀.

The larva of this species has the habit of boring under the bark and causing gall-like excrescences to appear upon the twigs of the common locust (*Robinia*).

**Genus CYDIA Hübner**

(1) Cydia pomonella Linnaeus. (The Coddling-moth.)

This well-known and most destructive little insect is estimated to inflict an annual loss upon the fruit-growers of America which amounts in the aggregate to tens of millions of dollars. Every one is familiar with the pinkish worm which is encountered at the heart of apples and pears. But for every apple and pear
Tortricidæ

which survives the attacks of these insects and develops sufficiently to come to market and to the mouth of the consumer, there are scores of apples and pears the development of which is entirely ruined, and they fall to the ground undersized and worthless. There are two broods of the insects annually. The second brood hibernates in the cocoon. We quote again from Riley: "The same temperature which causes our apple-trees to burst their beauteous blossoms releases the coddling-moth from its pupal tomb, and though its wings are still damp with the imprint of the great Stereotyping Establishment of the Almighty, they soon dry and expand under the genial spring-day sun, and enable each to seek its companion. . . . The moths soon pair, and the female flits from blossom to blossom, deftly depositing in the calyx of each a tiny yellow egg. As the fruit matures, the worm develops. In thirty-three days, under favorable circumstances, it has become full-fed; when, leaving the apple, it spins up in some crevice, changes to a chrysalis in three days, and issues two weeks afterwards as moth, ready to deposit again, though not always in the favorite calyx this time, as I have frequently found the young worm entering from the side."

The best remedy for the coddling-moth is to destroy all windfalls and immature fruit lying upon the ground. Make it a duty to keep the wind-fallen fruit garnered up once a week and fed to the pigs. Let the pigs into the orchard, if possible. Bind bands of hay about the trees. The caterpillars will form their cocoons among the hay in preference to any other place. Once a week crush the hay with the cocoons in it, and move the band up and down. Burn the wisp of hay if it gets full of cocoons, and bind

**Fig. 241. — C. pomonella.** a, burrow in apple; b, point where egg is laid; c, full-grown larva; d, pupa; e, moth at rest; g, moth with wings expanded; h, enlarged head of larva; i, cocoon. (After Riley.)
on another. The coddling-moth is an importation from Europe. Not all the live stock brought into America from Europe, biped or hexapod, has turned out well.

**Genus ALCERIS Hübner**

(1) *Alceris minuta* Robinson. (The Green Apple Leaf-tier.)

Syn. *malivorana* Le Baron; *vacciniivorana* Packard; *variolatia* Zeller.

The larvae of this insect feed in the early spring upon the young leaves of apple- and pear-trees, which they crumple up and tie together with threads of silk. Under the folded leaves they live and at last undergo their transformation into the pupal state. The caterpillars are green in color, and very nimble when disturbed, dropping to the ground or lowering themselves quickly upon a strand of silk. The chrysalis, as shown in the annexed cut, has a peculiar horn-like boss or projection at the upper end. The insect does much damage in the spring by preventing the proper expansion of the leaves in the terminal buds and by devouring the blossoms. The writer has for several years been greatly interested in observing the manner in which these pernicious little creatures have steadily robbed him of all fruit upon a couple of dwarf pear-trees which are growing at the rear of his city home. It has been found that a thorough spraying with a strong infusion of tobacco stems and slaked lime brings their work to a speedy end, and it is recommended to fruit-growers to resort to the application of this old-fashioned remedy when needed.

**Genus EPAGOGE Hübner**

(1) *Epagoge tunicana* Walsingham, Plate XLVIII, Fig. 40, 5.

This rather neatly marked moth, which may be accepted as a good representative of its genus, inhabits the Pacific subregion.

Tortricidæ

Genus CENOPIS Zeller

(1) Cenopis pettitana Robinson, Plate XLVIII, Fig. 35, ♀.
The habitat of this species is the Appalachian subregion.
(2) Cenopis groteana Fernald, Plate XLVIII, Fig. 28, ♂.
The insect is not uncommon in the Valley of the Ohio.

Genus ARCHIPS Hübner

(1) Archips rosaceana Harris, Plate XLVIII, Fig. 32, ♀.
Syn. vicariana Walker; gossypiana Packard; arcticana Moeschler.
This is a common species found all over the northern portions of the United States and southern Canada. The larvae inflict considerable damage at times upon roses and the foliage of allied plants.

(2) Archips purpurana Clemens, Plate XLVIII, Fig. 30, ♂.
Syn. gurgitana Robinson; lintneriana Grote.
In many respects this species is very closely allied to the last mentioned, from which it may be distinguished by the darker, more smoky color of the primaries. It has the same distribution as rosaceana.

(3) Archips cerasivorana Fitch, Plate XLVIII, Fig. 21, ♀.
The larva of this insect, as its name implies, is addicted to feeding upon the leaves of various species of wild cherry. It is found in the northern portions of the United States and southern Canada.

(4) Archips parallela Robinson, Plate XLVIII, Fig. 31, ♀.
The species ranges from New England westward into the Valley of the Mississippi.

(5) Archips argyrospila Walker, Plate XLVIII, Fig. 34, ♀.
Syn. furvana Robinson; v-signatana Packard.
The species, which is not at all uncommon, ranges through the northern portions of the United States from the Atlantic to the Pacific.

Genus PLATYNOTA Clemens

(1) Platynota flavedana Clemens, Plate XLVIII, Fig. 24, ♀.
Syn. concursana Walker; laterana Robinson.
The moth is a native of the Appalachian subregion.
(2) Platynota labiosana Zeller, Plate XLVIII, Fig. 25, ♀.

422
The insect is found in the southwestern portion of our territory, having been reported from Colorado and Texas.

Genus **TORTRIX** Linnaeus

(i) *Tortrix albicomana* Clemens, Plate XLVIII, Fig. 22, ♂.
The moth flies in the eastern portions of our region, being commoner in the Atlantic States than elsewhere.

Genus **EULIA** Hübner

(i) *Eulia alisellana* Robinson, Plate XLVIII, Fig. 39, ♀.
The insect is common in the Valley of the Ohio. It occurs in western Pennsylvania, Ohio, and Indiana.

Genus **AMORBIA** Clemens

(i) *Amorbia humerosana* Clemens, Plate XLVIII, Fig. 23, ♀.
The species is indigenous in the northern portions of the Appalachian subregion.

Genus **COMMOPHILA** Hübner

(i) *Commophila macrocarpana* Walsingham, Plate XLVIII, Fig. 26, ♀.
The insect is a native of the Pacific subregion.

**FAMILY YPONOMEUTIDÆ**

"Thus hath the candle sing'd the moth."

SHAKESPEARE.—*Merchant of Venice*, I, 9.

This is a family of moderate size, represented in our fauna by twenty-two genera and over sixty species. The species have a characteristic facies, which when once recognized will enable the student to readily separate them from their allies. We are able to figure only three species, owing to the necessary limitations of space.

Genus **YPONOMEUTA** Latreille

(i) *Yponomeuta multipunctella* Clemens, Plate XLVIII, Fig. 44, ♂.
Syn. *ordinatellus* Walker; *eunymella* Chambers; *orbimaculella* Chambers; *wakarusa* Gaumer.
Gelechiidae

The insect is found in the Appalachian subregion, but more particularly in the southeastern portions thereof.

Genus ATTEVA Walker

(1) Atteva aurea Fitch, Plate XLVIII, Fig. 36, ♂.
Syn. compta Clemens.
The insect is common in the southern portions of our region, being distributed from the Gulf States southward and westward in Mexico and lands still farther South.

(2) Atteva gemmata Grote, Plate XLVIII, Fig. 37, ♂.
Syn. fastuosa Zeller; floridana Neumegen.
The moth is found in the warmer parts of Florida.

FAMILY GELECHIIDÆ

"He buildeth his house as a moth." Job.—xxvii, 18.

This is a very extensive family of small moths which possess habits of considerable interest to students. Many of them are

![Illustration](image-url)

Fig. 243.—*P. operculella.* a, section of tuber showing eye and eggs deposited about it, natural size; b, egg, dorsal view; c, egg, lateral view, greatly enlarged; d, k, mines of larva in potato; j, pupa at end of mine, seen through skin of potato, somewhat reduced; e, larva, dorsal view; f, larva, lateral view; g, larva, third abdominal segment, lateral view; h, do., dorsal view, still more enlarged; i, pupa; l, moth, enlarged. (After Riley, "Insect Life," Vol. IV, p. 239.)
known to be more or less injurious to vegetables, in which they either burrow in their larval state, or upon the foliage of which they prey. We can speak of only a few of them.

Genus **PHTHORIMÆA** Meyrick

(1) *Phthorimæa operculella* Zeller. (The Potato-moth.)
*Syn. terrella* Walker; *solanella* Boisduval; *tabacella* Ragonot.

This insect, represented in Fig. 243, the ravages of which upon potatoes in Algiers and other Mediterranean countries have been well known for many years, and which has more recently caused much mischief in New Zealand and Australia, has quite recently found lodgment in California, having been apparently accidentally imported from Australia. In Algiers it is known in certain years to have destroyed fully two thirds of the potato-crop. It is a dangerous and annoying pest. The best remedy for it is said to be the total destruction of infected potatoes, and the protection of the stored tubers from access by the ovipositing females.

Genus **GNORIMOSCHEMA** Busck

(1) *Gnorimoschema gallæsolidaginis* Riley. (The Solidago Gall-moth.)

The man who has loitered by the waysides in the country must often have noticed the manner in which the stems of the common golden-rod are frequently swollen and enlarged about two thirds of their length from the root. This swelling may be caused by the larvae of several insects, but one of the most frequent causes of the abnormal growth is the larva of a little moth to which the above sesquipedalian name has been given. The life-history of the insect was carefully worked out by Professor Riley, and from his interesting paper upon the subject, contained
Gelechiidae

in the “First Missouri Report,” the accompanying cut has been taken. It shows a gall as it appears from the outside, and also a section of a gall, revealing the home which the larva constructed for itself in the enlargement of the stem.

The moth is very common in many parts of the country, but particularly in western Pennsylvania.

Genus ANARSIA Zeller

(i) Anarsia lineatella Zeller. (The Peach-twig Borer.)
Syn. pruniella Clemens.

The insect which we are considering was in all probability introduced into California, where it is now most firmly established, from Asia, probably from Japan. The eggs are deposited at the point where the leaves are attached to the stems, or where the stem of the fruit is located. The larvae make minute burrows under the bark of the twigs and into the stem of the fruit, and thus cause damage both to the trees and to the peaches. The insect is double-brooded. The larvae are secretive, and hide so effectually that it is said to be very difficult to detect them. The insect remains in the pupal state about ten days, when the moth emerges. The imago is about half an inch in expanse of wing. The fore wings are of a beautiful gray color, clouded on the costa with darker markings. The insects of the second generation hibernate as larvae in their burrows in the bark of the twigs.

A very full and excellent account of the habits of this insect has been published in the “Bulletin of the United States Department of Agriculture” by Mr. C. L. Marlatt. It is
from this paper that we have been with great kindness permitted to draw the illustrations which are herewith given.

As a means of combating this pest, it has been recommended to spray the peach-trees, just as the leaves are beginning to open in the spring, with a solution of one pound of lime and one pound of Paris green mixed in two hundred gallons of water. It is also recommended to spray the trees in February, or even in January, with kerosene emulsion, which is said to penetrate the little burrows in which the larvae hibernate and kill them. The latter method is undoubtedly preferable.

CUPID'S CANDLE

"Round her flaming heart they hover,
Lured by loveliness they go
Moth-like, every man a lover,
Captive to its gleam and glow.

Old and young, the blind and blinking,—
Fascinated, frenzied things,—
How they flutter, never thinking
What a doom awaits their wings!

It is all the same old story,—
Pleasure hung upon a breath:
Just a chance to taste of glory
Draws a legion down to death.

Fire is dangerous to handle;
Love is an uncertain flame;
But the game is worth the candle
When the candle 's worth the game!"

Xyloricidae

FAMILY XYLORICTIDÆ

A small family which contains in our fauna two genera and nine species. The group may be represented by Stenoma schlægeri Zeller, which is portrayed on Plate XLVIII, Fig. 41, by a male specimen. The insect is very common in the Appalachian subregion, and is particularly abundant in western Pennsylvania.

FAMILY CECOPHORIDÆ

"Entomology is a science, not a pastime."—Westwood.

This is another comparatively small family of interesting insects, numbering in our fauna about ninety species, which are distributed into thirteen genera. We can represent only a couple of them, for the purpose of showing the readers of "The Moth Book" what they are like.

Genus DEPRESSARIA Haworth

(1) Depressaria heracliana De Geer. (The Parsnip Web-worm.)

Fig. 247.—D. heracliana. a, larva, side view; b, dorsal view; c, pupa; d, anal extremity of pupa; e, moth, enlarged; f, umbel of parsnip webbed together by the larva, natural size. (After Riley.)

Syn. heraclei Retzius; umbellana Fabricius; umbellella Zetterstedt; pastinacella Duponchel; ontariella Bethune.

The Parsnip Web-worm is an importation from Europe,
where it has been known from time immemorial as an enemy of umbelliferous plants. A full account of the insect is given by Riley in "Insect Life," Vol. I, p. 94. To this the reader may refer. The remedy for the insect is to gather the portions of the plants which have become infested, and to burn them. The insects, many of which conceal themselves in the stems or are hidden in the foliage, are thus most conveniently destroyed.

Genus SEMIOSCOPIS Hübner

(1) Semioscopis merricella Dyar, Plate XLVIII, Fig. 38, ♂. This is not at all an uncommon insect in western Pennsylvania. There are numerous specimens in the collection of the writer which have been taken during the past twenty years.

FAMILY BLASTOBASIDÆ

This is a considerable family of minute moths, as representative of which we have selected for illustration a species of the genus Holcocera, to which Professor Riley applied the specific name glandulella, because it infests acorns. The Acorn-moth is an inquiline; that is to say, it takes possession of the remnants of the repast left in the acorn by the grub of a weevil, which has developed within the fruit and forsaken its burrow in order to undergo transformation elsewhere. Between the weevil and the larva of the moth very little is left of the contents of the acorn, and farmers who expect to derive sustenance for their hogs from the oak-mast are often disappointed. The accompanying cut shows the different stages in the development of the larva, and also the moth. The insect is quite common in Pennsylvania, Ohio, and Indiana.

429
FAMILY ELACHISTIDÆ

This is a large family of moths, many of which are almost microscopic in size, but all are very beautiful. One of the larger species we have selected for illustration. It lives in the galls which its presence produces in the stems of the FalseIndigo (Amorpha fruticosa). It belongs to the genus Walshia, and was described under the specific name amorphella by Clemens. In its habits it reminds us somewhat of the moth with the frightful name which lives in the galls of the Golden-rod, about which something has already been said. The accompanying cut, which has been taken from Professor Riley's "Second Missouri Report," shows at a a figure of the female moth enlarged. The larva, which is a soft white little affair, is delineated at b, and the figures c and d show the galls as they appear. The insect is found in the Appalachian subregion.

FAMILY TINEIDÆ

"Lay not up for yourselves treasures upon earth, where moth and rust doth corrupt, and where thieves break through and steal: but lay up for yourselves treasures in heaven, where neither moth nor rust doth corrupt, and where thieves do not break through nor steal."

Matthew.—vi, 19, 20.

The Tineidæ are a very great family of moths, some of which are of moderate size, but most of which are very minute. Among them there are many insects which are exceedingly beautiful, although they are so small, while many of them have great economic importance, being destructive or beneficial. Of a few of these we shall take opportunity to speak briefly.
Genus BUCCULATRIX Zeller

(1) Bucculatrix canadensisella Chambers. (The Birch-leaf Bucculatrix.)

This little insect in its larval stage is known to infest the leaves of the birch and the wild cherry. The caterpillars feed upon the parenchyma of the leaves, attacking both the upper and the lower sides, and completely skeletonizing them. Forests of birches in New England are known to have been completely stripped of living tissue in the fall of the year, in such a manner as to suggest that a fire had passed over the trees. The larvae are sluggish in their movements, when disturbed dropping down by a silken cord. The cocoons are white and ribbed, as represented in the annexed figure. They turn dark after they have been spun up for some time. The insect is not uncommon in Rhode Island, and is known to occur throughout New England, northern New York, and Canada. It probably has even a wider range, and may be found in the mountains of Pennsylvania, where its food-plant is abundant. The best account of its habits has been given by Professor A. S. Packard in "Insect Life," Vol. V, p. 14.

(2) Bucculatrix pomifoliella Clemens. (The Apple-leaf Bucculatrix.)

Syn. pomonella Packard; curvilineatella Packard.

The minute moth, a greatly enlarged figure of which is given in the annexed cut, has the habit of denuding the leaves of apple-
trees of their parenchyma. While it does not appear to have wrought great destruction generally, nevertheless there are instances on record where it has done much damage in orchards. The larvæ have the habit of forming their cocoons in company, attaching them to the twigs in great clusters, as represented in Fig. 251. This fact has led to the recommendation that the trees, when infested, should be lightly pruned all over in the fall, and the twigs carefully collected and burned. As the cocoons are located at the ends of the twigs, this may be a partially effective remedy. Another remedy is to thoroughly spray the trees with coal-oil emulsion or with linseed-oil. The greasy application is said to destroy the pupæ in the thin papery cocoons.

Genus TINEOLA Herrich-Schaeffer

(1) Tineola bisselliella Hummel. (The Clothes-moth.)

Syn. crinella Treitschke; destructor Stephens; bisselliella Zeller; lanariella Clemens.

There are several species of Tineid insects which attack garments made of woollen fiber and furs. One of the commonest and most widely distributed of these is the insect which we are now considering. In Pennsylvania and in Maryland and southward, so far as observation shows, this is the commonest of the "Clothes-moths." The damage, it is needless to say, is not done by the
Tineidae

imago, or perfect insect, but by the larva, or caterpillar. This is represented in all its destructive ugliness in the annexed cut. Its food is animal fibers, and it constructs for itself a cocoon of bits of wool or hair, in which transformation into a pupa finally takes place. It is partial to all animal hair. It feeds upon furs, woolens, carpets, horsehair mattresses, and even to some extent upon silken fabrics, though it has no positive preference for the latter. The insect, like all the others of its class, has been introduced into this country from the Old World. In a separate article the writer will speak of the best method of preventing its ravages.

Genus TINEA Linnaeus

(1) Tinea pellionella Linnaeus. (The Fur-moth.)

Syn. flavescertella Haworth; merdella Zeller; dubiella Stainton; griseella Chambers.

This insect makes for itself a movable case in which it travels about in the larval stage. Its food is very much the same as that of the preceding species, and it is equally destructive. The moth differs from the pale-colored Clothes-moth in having the fore wings darker. They are, in fact, quite gray, mottled with darker gray, as shown in the cut which we have herewith caused to be reproduced. A comparison between the figures of this and the succeeding species will enable the student to readily discriminate them. The lower left-hand figure gives a good representation of the case made out of bits of hair in which the caterpillar performs its migrations. The insect is many-brooded, according to the temperature of its domicile. In the warmer parts of the country the processes of generation no doubt go on continuously.
In the colder parts of the country winter arrests development temporarily.

The insect is widely distributed all over the continent, and in fact all over the world.

**Genus TRICHOPIAGA Ragonot**

(1) *Trichophaga tapetzella* Linnaeus. (The Carpet-moth.)

The nature and habits of this species are very closely allied to those of the last two species of which we have spoken. Like them, it was originally introduced into America from the Old World. It differs from them in the larval state in that, instead of simply making a cocoon for itself out of bits of hair as the Clothes-moth, or forming a movable case for itself as the Fur-moth, it weaves together, out of the debris of the material in which it is carrying on its ravages, long galleries lined inside with strands of silk. These long, tortuous galleries, cut through the pile of carpets, are familiar objects to the careful housewife, whose horror and anxiety have often been expressed to the writer. It is one of the sad prerogatives of the entomologist to be made from time to time the recipient of the household woes of his neighbors, who discover that the moth and the buffalo-bug “corrupt,” and that the white ant and the cockroach “steal.”

The perfect insect, as shown in the annexed cut, is in appearance a very different moth from either of the foregoing species.

**CLOTHES-MOTHS**

"The moth shall eat them up like a garment, and the worm shall eat them like wool."

Isaiah.—li, 8.

From the accounts which have been given in the preceding pages of the three species of Clothes-moths, the ravages of which are commonly encountered in the household, it has been learned that they may each be discriminated from the other by the habits of the larvæ. The Carpet-moth makes a gallery of the substance
on which it feeds; the Fur-moth makes a small portable case, which it carries with it; while the insect which we have called the Clothes-moth lives for the most part free until the time of pupation, when it constructs for itself a cocoon out of bits of fiber.

All of these three species are equally destructive, and there is no question which is more frequently asked of the writer than how best to destroy the insects when once they have found lodgment in a house, and how to prevent their attacks.

All of these creatures "love darkness better than light, their deeds being evil." When it is suspected that furs or garments are infected by their presence, the first step which should be taken is to expose them to full sunlight, the hotter the better. Garments in which moths are known to exist should be hung up in the open air. And this airing and exposure to sunlight should not be for an hour or two, but, if possible, it should extend over a number of days, and should take place in the latter part of May or the early part of the month of June, at which time the female moth is engaged in ovipositing. Where it is impossible to air and expose to sunlight the fabrics which have been attacked, as is sometimes the case with carpets in dark corners, they should be thoroughly saturated with benzine. It is needless to say that this operation should never be undertaken in the presence of a candle or other exposed light. Furniture in carpeted rooms should in the spring of the year be removed from the place where it has long stood, and the spot should be thoroughly sponged with benzine. A solution of corrosive sublimate in alcohol, so weak that it will not leave any white mark upon a black feather which has been dipped into it and afterward dried, may be applied effectively to carpets and to fabrics which are exhibited in museum cases. At the Carnegie Museum we make it a rule to spray all substances which might be exposed to the attack of moths, when hung in cases, with a solution of corrosive sublimate and strychnine in alcohol.

In carpet warehouses and in establishments where wooler goods are stored in quantity it is well to have on the roof of the building an apartment fitted up with large air-tight chests. Into these chests, or compartments, fabrics supposed to have been attacked by moths may be put and exposed for twenty-four or
more hours to the fumes of carbon bisulphide. This fluid should be placed in large quantity in shallow pans at the bottom of the disinfecting-chambers, in such a way that it will not come directly in contact with the fabrics. Being volatile, the fumes will gradually fill the entire chamber, and will destroy all animal life. Inasmuch as carbon bisulphide, as has already been stated elsewhere in this book, is, when mixed with atmospheric air, highly explosive, no lights should be allowed to come near the chests, or the apartment in which the disinfection is taking place. The writer has in his own household made it a rule in the spring of the year to take all rugs and have them placed in a large chest about four feet long, three feet wide, and three feet deep, at the bottom of which there is a slatted support beneath which is a long, shallow pan. Into this pan the bisulphide is poured. The rugs are loosely placed in the chest, and then it is closed tightly and they are left there for forty-eight hours.

The storage of furs and woolen garments during the summer months is an important matter. The one thing to be perfectly ascertained before placing garments in storage is that they are thoroughly disinfected and that not a single female moth capable of depositing fertile eggs is present. This fact being known with certainty, all that it is necessary to do is to place the garments in clean air-tight receptacles and close them up so that nothing can get into them. Garments may be put into perfectly tight paper bags with all openings pasted shut with a piece of tough paper. The boxes in which tailors send home garments are good storage receptacles, provided the garments are free from pests when put into them and provided every opening in the box is pasted shut with a piece of paper. It is not an altogether unwise precaution to put in "moth-balls" or crystals of naphthaline or bits of camphor, but it must be borne in mind that neither naphthaline nor camphor will kill the larvæ of moths that have once found access to the garments upon which they are in the habit of feeding. A great deal of money has been uselessly expended upon such substances, when all that is necessary is simply to insure the exclusion of the pests.

The annual loss occasioned by these minute yet most annoying insects is vast, and it is not unreasonable to say that their mischievous depredations cost the citizens of the United States
annually a sum of money which is enough in amount at the present time to pay the interest upon the national debt.

Genus ADELA Latreille

The moths of this genus are remarkable for the enormous length of their antennæ in proportion to their size. We have represented one of the commoner species on Plate XI. VIII, Fig. 45. It received the specific name bella at the hands of the late Mr. V. T. Chambers. The base of the antennæ is black, and the extremity is white. This fact has prevented the photographer from getting a full representation of the length of the organ in our cut. This is much to be regretted, and the student must add in his imagination to the antennæ, as they are shown, a thread-like extension, extending fully three eighths of an inch beyond the apparent ending of the organs as depicted. The moths may be found in shaded woods in June feeding upon the flowers of Asclepias.

Genus PRODOXUS Riley

The relation of the insect world to the life of plants has been the subject of a great deal of interesting inquiry in recent years. It has been discovered that many genera and species depend for their fructification and consequently for their continued preservation upon the agency of insects. Without the kind attention which they receive from the tiny creatures of the air, they would not produce seed, and the race would speedily become extinct. One of the most beautiful illustrations of the interdependence of the world of plants and the world of insects has been discovered in the case of the Tineid genus Pronuba. This insect has become specialized to a remarkable degree, as we shall have occasion to show in speaking of it. In fact, without its agency the pollination of the plants belonging to the genus Yucca is never accomplished. But, curiously enough, associated with it and closely resembling it superficially is a genus of moths which does not possess the power of pollinizing the Yucca, but which is represented by many species the larvae of which feed in the stems of the various species of Yucca. The Yucca plants depend for the perpetuation of the species upon the moth Pronuba. The moth Prodoxus depends upon the Yucca plants for life, and thus
Tineidæ

indirectly upon the labor of Pronuba. The whole story is one of the most interesting in the annals of insect life, and the student who is curious to know all about its interesting details should consult the fourth volume of "Insect Life," where Professor Riley has with minute patience worked out the wonderful story, with all the skill of a Sherlock Holmes.

(1) Prodoxus quinquepunctella Chambers. (The Bogus Yucca Moth.)

Syn. decipiens Riley; paradoxica Chambers.

This little moth, which superficially resembles Pronuba yuccasella, has no maxillary tentacle such as is found in the latter insect. Its absence is characteristic, in fact, of all the species of the genus. The ovipositor is homologous to that of Pronuba, but is a stronger instrument intended for making incisions in the tender bark of the stem, while the ovipositor of Pronuba is a long, slender organ which is used to thrust the egg into the ovarian cavity of the growing seed-vessel.

The larvae of the various species of Prodoxus are without feet, quite maggot-like, and remain in their burrows in the stems of the Yucca plants, not descending to the ground to pupate, as do those of Pronuba. The pupae, when the time for emergence arrives, protrude themselves from the stems, and the moth escapes from the pupal skin, very much in the way in which the same act is performed by various species of

Fig. 255.—P. quinquepunctella. a, larva; b, head from above; c, d, left jaw and antenna; e, pupa; f, infested stem, showing burrows, castings, cocoons, and pupa-shell, h. All enlarged. (After Riley.)
wood-burrowing Ægerians. The cut, Fig. 255, taken from the writings of Professor C. V. Riley, has more value as an explanation of the facts in the case than a whole page of verbal description would have. The species of the genus Prodoxus all appear upon the wing before those of the genus Pronuba, the former having no function to perform in connection with the fertilization of the flowers, and being on the spot to oviposit while the flower-stems are still soft and easily capable of being cut into by the ovipositor of the female, while Pronuba must wait until the flowers are opening and the tissues of these portions of the plant are ready for the peculiar operations which the perpetuation of the life both of the plant and the insect call for.

(2) Prodoxus marginatus Riley.

The accompanying cut serves to show the characteristic features of this species of the genus. The figure at a gives a view of the last abdominal segment of the female magnified twenty-six diameters. The basal joint of the ovipositor is represented at bjo, the terminal joint at tjo, and the oviduct at ov. Figure c represents the claspers of the male viewed from above. A view of the fore wing magnified five times is given at pr., and by it the species may be known.

(3) Prodoxus y-inversa Riley.

The main characteristics of a third species of the genus are given in Fig. 258. The left front wing is represented at a, the hair-line beneath serving to show the natural size of the wing. By looking at the figure upside down the reader will understand why the specific name which was given to the moth originally suggested itself. The genitalia of the male moth are represented at b enlarged fourteen diameters. This view is taken from above.
and gives the dorsal aspect of these organs. At c we have a lateral view of the same parts magnified eighteen diameters. The ovipositor of the female is shown at d exserted from the anal joint of the abdomen. At e there is given another lateral view of the tip of the ovipositor much more enlarged. This view shows the peculiar saw-like structure of the organ, by help of which incisions are made in the soft outer bark of the growing stems of the Yucca. Both this and the preceding species are found in California.

(4) Prodoxus reticulata Riley.
This pretty little moth, the habits of which are much the same as those of the preceding three species, is a native of the State of Colorado. The figure represents a female with her wings expanded, and the drawing is magnified more than three times the size of life. The insect is undoubtedly, so far as the markings of the wings are concerned, the most attractive species in the entire genus.

(5) Prodoxus coloradensis Riley.
Fig. 260 is devoted to the illustration of the salient specific features of a fifth insect belonging to the genus Prodoxus. As the name implies, this species, like the preceding, is found in Colorado. The front wing is shown four times the size of life, the hair-line below the figure indicating the natural size. The genitalia of the male are shown at b viewed from above, and at c viewed laterally.
(6) **Prodoxus cinereus** Riley.  
This species is known to breed in the flower-stems of *Yucca whipplei*. The best way in which to set the species before the reader seems to be to reproduce, as we have done, the figure given by the author of the species, in which its characteristic features are carefully depicted. It is found in California.

**Genus PRONUBA Riley**

(1) **Pronuba yuccasella** Riley. (The Yucca Moth.)

No discovery in recent years has been more interesting to students of insect and plant life than that which was made in 1872 by Professor Riley, of the intimate relationship which subsists between the beautiful plants, known as Yuccas, and the genus of moths to which the present species belongs. It has been ascertained that the fructification of the various species of Yucca is almost absolutely dependent upon the agency of the female moth; and, strangely enough, it has also been ascertained that the pollination of the flowers is not the result of mere accidental attrition of the wings and other organs of the insect when engaged in seeking for nectar in the flower and when engaged in laying her eggs, but that she deliberately collects the
Tineidae

pollen with her mouth, which is peculiarly modified to enable her to do this, and then applies the pollen to the stigma with infinitely better care than it could be done by the most skilful horticulturist using the most delicate human appliances.

There are several species of the genus Pronuba, and they hold a positive and well-ascertained relationship to the various species of the plants in the economy of which they perform so important a function. Pronuba yuccasella pollinizes in the Eastern States the blossoms of the common Yucca filamentosa, and on the Western plains it performs the act for the blossoms of Yucca angustifolia. Yucca brevifolia is pollinized by Pronuba synthetica. Yucca whipplei is pollinized by Pronuba maculata. No doubt there are other species of Yucca which will be ultimately discovered to have species of Pronuba which are adapted in their organs to the work of pollination according to their peculiar requirements.

The larva of Pronuba, after it has attained to full size, drops to the ground, having three pairs of thoracic legs, which enable it to move about and burrow into the earth. It then undergoes transformation into the pupal state. The chrysalis, which is depicted in Fig. 263, has the back armed with peculiar spinous processes, which enable it to make its way through the loose soil.

The student who desires to become fully acquainted with this interesting chapter in insect life must consult the altogether admirable papers written upon the subject by Professor Riley, to whom we are indebted for almost all that we know in regard to the subject. These papers may be found in the Publications of the St. Louis Academy of Science, the "Fifth

Fig. 262.—*P. yuccasella*. a, larva; b, female moth with closed wings; c, do. with wings expanded; d, side view of larval segment; e, head of larva from below; f, do. from above; g, thoracic leg of do.; h, maxilla; i, mandible; j, spinneret and labial palpi; k, antenna, enlarged. (After Riley, "Insect Life," Vol. IV, p. 360.)

Yucca brevifolia is pollinized by Pronuba synthetica. Yucca whipplei is pollinized by Pronuba maculata. No doubt there are other species of Yucca which will be ultimately discovered to have species of Pronuba which are adapted in their organs to the work of pollination according to their peculiar requirements.

The larva of Pronuba, after it has attained to full size, drops to the ground, having three pairs of thoracic legs, which enable it to move about and burrow into the earth. Tineidæ

Annual Report of the State Entomologist of Missouri," and in the fourth and fifth volumes of "Insect Life."

Genus ACROLOPHUS Poey

(1) **Acrolophus plumifrontellus** Clemens, Plate XLVIII, Fig. 43, ♂.

*Syn. bombycina* Zeller.

As a representative of this well-marked genus, quite a number of species of which are found in our fauna, we have selected the species which is most common in the Appalachian subregion. The other species are mainly Southern and Western.

Genus ANAPHORA Clemens

(1) **Anaphora popeanella** Clemens, Plate XLVIII, Fig. 42, ♂.

*Syn. agrotipennella* Grote; *scardina* Zeller.

The insect ranges from the Atlantic States to the Rocky Mountains. There are other species in the genus, which are found in the South and the West.

FAMILY HEPIALIDÆ

This family is composed of large or moderately large insects. They are very peculiar in their structure, and are now by systematists generally accorded a position of inferiority at the bottom of the series of lepidopterous families, being regarded as representing an ancestral stock. Some go even so far as to deny that they are lepidoptera at all. This is, however, an untenable position.

Genus STHENOPIS Packard

(1) **Sthenopis argenteomaculatus** Harris, Plate XLI, Fig. 14, ♂. (The Silver-spotted Ghost-moth.)

*Syn. argentata* Packard; *alni* Kellicott.

The larvae feed at first upon the roots of the alder, and then enter the stems. The insect is found in the northern portions of the United States and Canada. The moths have the habit of dancing in the air at sunset, and perform very peculiar gyrations over the spot where oviposition is to take place.

(2) **Sthenopis quadriruguttatus** Grote, Plate XLI, Fig. 13, ♂.

*Syn. semiaturatus* Neumægen & Dyar.

443
Hepialidae

The range of this species is the same as that of the preceding. It occurs rather abundantly in Assiniboia and Alberta.

Genus HEPIALUS Fabricius

(1) *Hepialus hyperboreus* Mœschler, Plate XLI, Fig. 15, ♂. Syn. *pulcher* Grote; *macglashani* Henry Edwards.

The moth is found in New England and southern Canada.

(2) *Hepialus gracilis* Grote. (The Graceful Ghost-moth.)

This species, the neuration of the wings of which is represented in the text at Fig. 12, is not an uncommon species in the northern portions of our territory.

(3) *Hepialus lemberti* Dyar, Plate XLI, Fig. 16, ♂. (Lembert's Ghost-moth.)

The moth is found in California. It is not as yet common in collections.

FAMILY MICROPTERYGIDÆ

This family is represented in our fauna by two genera of minute insects and six species. They are remarkable because revealing certain anatomical features which are believed to point to an ancestral connection between them and other orders of insects. One of the remarkable features which they reveal is the persistence in them of mandibles in the pupæ, which are lost in the imaginal form in the genus *Micropteryx*, which is not represented in our fauna, but are persistent in the genus *Eriocephala*, which does occur in North America.

We have arrived at last at the end of our necessarily compacted but rather extensive survey of the families of moths represented in the fauna of the United States and Canada. We have thrown the doors of our subject open to the curious. We have thrown them wide open. Much has been omitted which might have been said; possibly some things have been said which will have little interest for the general reader; but, upon the whole, we feel, in bringing this book to its end, that we have given a fuller and more complete review of the whole subject to American students than has ever been essayed in any book by any
other writer. Throughout the task has been to a large degree a labor of love, with the purpose of popularizing knowledge and helping those who have eyes to see and ears to hear, to understand something of the wonders of a world which becomes the more wonderful the more we know of it.

THE FINAL GOAL

"O, yet we trust that somehow good
Will be the final goal of ill,
To pangs of nature, sins of will,
Defects of doubt and taints of blood;
That nothing walks with aimless feet;
That not one life shall be destroyed,
Or cast as rubbish to the void,
When God hath made the pile complete;
That not a worm is cloven in vain,
That not a moth with vain desire
Is shrivelled in a fruitless fire,
Or but subserves another's gain."

TENNYSON.—In Memoriam, I, III.

THE END

When the moon shall have faded out from the sky, and the sun shall shine at noonday a dull cherry-red, and the seas shall be frozen over, and the ice-cap shall have crept downward to the equator from either pole, and no keels shall cut the waters, nor wheels turn in mills, when all cities shall have long been dead and crumbled into dust, and all life shall be on the very last verge of extinction on this globe; then, on a bit of lichen, growing on the bald rocks beside the eternal snows of Panama, shall be seated a tiny insect, preening its antennæ in the glow of the worn-out sun, representing the sole survival of animal life on this our earth,—a melancholy "bug."
